1887-'88 CONTENTS.

CHAPTER I.—THE COMMISSIONER'S EXECUTIVE STATEMENT.

	Page.
Time covered by the statement.....	1
Division of Records.....	1
Division of the Library and Museum.....	2
Division of Statistics.....	4
Plan of the present Report.....	4
Recent publications of the Office.....	5
Education in Alaska.....	8
The colony at New Metlakatla.....	9
New regulations and amendments.....	10
Changes in the Territorial board.....	11
Increased appropriations for Alaska needed.....	11
Change in school books.....	11
The Bureau's contribution to the Ohio Valley Centennial.....	11
Estimates for 1890-91.....	12
Quarters for the Office of Education.....	13
Opinion of the National Educational Association.....	15
A suitable building for the Bureau.....	15
Expenditure of the Bureau's fund for printing.....	16

CHAPTER II.—THE COMMISSIONER'S EDUCATIONAL STATEMENT.

The American public school system.....	18
The condition of education in the South.....	20
Facts revealed by the census of 1880.....	21
Adults and minors in 1880, North and South.....	23
Wealth and minor population in 1880, North and South.....	24
Density of school population in 1880, North and South.....	27
Condition of industry in the South.....	29
Sources of school revenue.....	32
The record for the year.....	33
Manual training.....	33
The history of American education.....	35
History of Education in Virginia.....	35
History of Education in North Carolina.....	40
History of Education in South Carolina.....	42
History of Education in Georgia.....	45
History of Education in Florida.....	46
History of Education in the North-West—Indiana.....	49
History of Education in Wisconsin.....	53
Object of this series of monographs.....	54
History of Federal and State Aid to Higher Education.....	56
Action of the National Educational Association.....	59
Conclusion.....	59

CHAPTER III.—STATE COMMON SCHOOL STATISTICS.

Preliminary remarks.....	61
Population statistics, how computed.....	61
End of school year; statistics of population and population 6-14 (Table 1).....	62
School ages and school censuses (Table 2).....	63

	Page.
Enrolment (Table 3).....	64
Average daily attendance (Table 4).....	66
Total attendance; duration of schools (Table 5).....	68
Number of school buildings; seating capacity (Table 6).....	70
High schools (Table 7).....	72
Private schools (Table 8).....	73
Teachers (Table 9).....	75
Salaries of teachers (Table 10).....	77
School revenues (Tables 11, 12, and 13).....	78
School expenditures (Tables 14, 15, and 16).....	82
Permanent school funds, total assessed valuation, and valuation of school property (Table 17).....	86
Chief State school officers (Table 18).....	88

CHAPTER IV.—DIGESTS OF STATE SCHOOL REPORTS.

Alabama.....	89
Arkansas.....	92
California.....	94
Dakota.....	96
Delaware.....	100
District of Columbia.....	102
Florida.....	105
Georgia.....	106
Idaho.....	107
Kansas.....	111
Louisiana.....	112
Maryland.....	114
Michigan.....	115
Minnesota.....	116
Missouri.....	117
Montana.....	119
Nebraska.....	121
Nevada.....	123
New Hampshire.....	125
New Jersey.....	126
New Mexico.....	129
New York.....	130
North Carolina.....	135
Oregon.....	137
Pennsylvania.....	139
Rhode Island.....	140
South Carolina.....	143
Tennessee.....	144
Texas.....	146
Utah.....	148
Vermont.....	150
Washington.....	152
West Virginia.....	153
Wisconsin.....	155
Wyoming.....	156

CHAPTER V.—DISCUSSIONS OF EDUCATIONAL QUESTIONS, CHIEFLY BY STATE SUPERINTENDENTS.

Administration.....	157
Arbor Day.....	159
Compulsory attendance.....	160
Discipline.....	160
Education.....	161
Evening schools.....	162
Graded schools.....	162
High schools.....	163
Hygiene.....	163
Irregular attendance.....	163
Language of the public schools.....	164

	Page.
Libraries for schools.....	165
Manual training.....	166
Moral training.....	167
National aid.....	167
Private schools.....	168
Prizes.....	168
Public schools.....	168
Revenue.....	170
School-houses.....	170
Supervision.....	171
Teachers.....	173
Temperance instruction.....	175
Text-books.....	176
What shall be taught in the public schools?.....	178
Word method of teaching reading.....	180

CHAPTER VI.—ALASKA.

Report of the president of the board of education.....	181
Letter transmitting the report of the general agent of education.....	182
Report of the general agent to the Territorial board.....	183
Number and general condition of the schools.....	183
Regulations prescribed by the Territorial board.....	188
School census; public and private schools.....	189
Names, stations, and salaries of school officers and teachers.....	191
Respecting the general agent's duties.....	191
Additional information.....	191

CHAPTER VII.—DISCUSSION OF QUESTIONS RELATING TO CITY SCHOOL SYSTEMS.

Introduction.....	195
Substitute teachers.....	195
The departmental plan in elementary schools.....	196
Thoroughness.....	197
Half-day sessions.....	199
Promotions.....	201
Examinations as a basis for promotion.....	206
Primary schools.....	209
Age for admission to primary schools.....	210
Physical training.....	211
Summer schools.....	213
School buildings.....	214
Pernicious methods of heating school-houses.....	215
Irregularity of attendance.....	217
Discipline.....	218
Incorrigibles and habitual truants.....	219
Suburban schools.....	222
Evening schools (Table 19).....	223

CHAPTER VIII.—STATISTICS OF CITY SCHOOL SYSTEMS.

Explanation of terms used.....	228
Names of city superintendents.....	231
Population and school enrolment and attendance (Table 20).....	237
Teachers, accommodations, and salaries (Table 21).....	258
Property and receipts (Table 22).....	271
Expenditures (Table 23).....	292
Public high schools (Table 24).....	314
List of cities from which no reports were received.....	335
Comparative statistics of enrolment, attendance, teachers, and sittings (Table 25).....	337
Summary of same by States, etc. (Table 26).....	360
Comparative statistics of property, tuition expenses, and receipts from local taxation (Table 27).....	362
Summary of same by States, etc. (Table 28).....	377

CHAPTER IX.—THE TRAINING OF TEACHERS.

	Page.
An examination of normal school work not sufficient	379
Teachers' associations	380
Review of discussions of the year	381
Chairs of pedagogy	381
Normal schools	381
Teachers' institutes	382
Local supervision	386
The College for the Training of Teachers of New York City	386
Schedule of special and extra classes for adults	389
Schedule of children's special and extra classes	390
Peabody Normal College	390
National Normal College	392
Physical and manual training in normal schools	393
Proceedings of the Normal Department of the National Educational Association	395
The Peabody Fund	397
Distribution of the income	398
Statistics for the year	398
Do the normal school graduates teach	399
Experience of teaching corps	400
Normal element in teaching corps	400
Beginners	401
Public normal schools	402
Summary of statistics of teachers and pupils (Table 29)	403
Summary of statistics of aid from public funds and other sources (Table 30)	405
Private normal schools	405
Summary of statistics of teachers and pupils (Table 31)	406
Kindergarten training schools	406
Notes relating to normal schools and other instrumentalities for improving the teaching body.	408
Alabama	408

Vermont	453

	Page.
Notes relating to normal schools, etc.—Continued.	
Virginia	454
West Virginia	455
Wisconsin	456
Statistics of public normal schools (Table 32)	459
Statistics of private normal schools (Table 33)	472
Statistics of schools and classes for training kindergarten teachers (Table 34)	479

CHAPTER X.—SECONDARY INSTRUCTION.

Effort and purposes of the Office with respect to secondary schools	481
Scholastic work of secondary schools	482
Number and classification of students in specified branches and courses for all private secondary schools (Table 35)	482
Comparative statistics of private schools for girls (Table 36, Division A)	483
Comparative statistics of private schools for boys (Table 36, Division B)	484
Comparative statistics of private schools for both sexes (Table 36, Division C)	485
Distribution of time among specified studies in certain private schools (Table 37)	486
Summary of statistics of public high schools (Table 38)	490
Distribution of time among specified studies in certain public high schools (Table 39)	491
Statistical summary of scholars in secondary schools and departments	494
Summary of statistics of instructors and students in all private schools (Table 40)	494
Summary of statistics of private schools for girls (Table 41, Division A)	496
Summary of statistics of private schools for boys (Table 41, Division B)	498
Summary of statistics of private schools for both sexes (Table 42, Division C)	500
Detailed view of private secondary schools	502
Agencies for promoting secondary instruction	505
Statistics of private schools for girls (Table 42, Division A)	507
Statistics of private schools for boys (Table 42, Division B)	525
Statistics of private schools for both sexes (Table 42, Division C)	543

CHAPTER XI.—SUPERIOR INSTRUCTION.

Introduction	583
Colleges and seminaries for women	583
Attendance of women in colleges and seminaries	583
Summarized statistics	584
Summary of statistics of colleges for women (Table 43)	585
Detailed view of colleges for women	586
Remarks on Table 44, Division A	586
The Harvard Annex, Cambridge, Mass.	587
Bryn Mawr College, Bryn Mawr, Pa.	589
Art schools in colleges for women	590
Smith College, Northampton, Mass.	591
Wellesley College, Wellesley, Mass.	592
Vassar College, Poughkeepsie, N. Y.	593
Statistics of colleges for women (Table 44, Division A)	594
Detailed view of colleges for women	596
Statistics of colleges for women (Table 44, Division B)	604
Universities and colleges of liberal arts	622
Remarks on the statistical tables	622
State aid for State universities	623
Statistics of foundations comprising groups of related faculties, etc. (Table 45)	624
Statistics of State universities (Table 46)	626
Summary of statistics of colleges of liberal arts (Table 47)	628
Growth and present status of universities and colleges	632
Distribution of college students in the several degree courses, from 1882-83 to 1887-88, inclusive (Table 48)	634
Detailed view of colleges	636
Alabama	636
Arkansas	637
California	637
Colorado	638
Connecticut	638
District of Columbia	641
Dakota	644

Detailed view of colleges—Continued.

Georgia	644

Sloyd	848
Sewing.....	850
Sewing course of the Springfield (Mass.) schools	851
Cooking	851
Course in cooking of the Washington (D. C.) schools	852

	Page.
Manual training course of study for New York City.....	853
Primary schools.....	853
Grammar schools.....	854
Course of the Paris public schools.....	856
Public manual training schools (Russian system).....	857

III—STATISTICS.

As a public school study in 1888	858
Introduction into the schools of New York.....	859
State action.....	859
Opinions of city superintendents and others on manual training.....	860
Industrial associations.....	873
Characteristics of manual training in public school systems.....	874
Number of instructors and pupils in the several branches of manual training (Table 71)...	875
Number and duration of lessons a week for manual training classes (Table 72).....	877
Cost of introducing and maintaining manual training (Table 73).....	878
Abstracts of the returns to this Office.....	880
Statistics of manual training schools.....	885
The Imperial Technical School of Moscow.....	885
The special professional schools of Germany.....	888
Apprentice schools of France.....	888
The manual training school.....	889
Characteristics of American manual training schools.....	892
Officers and connection of manual training schools (Table 74).....	893
Controlling bodies and methods of their appointment (Table 75).....	896
Requirements for admission, fees, and length of course (Table 76).....	898
Literary and manual courses of study (Table 77).....	900
Course of study of the higher elementary schools of France.....	903
Instructors and pupils (Table 78).....	904
Finances and property values (Table 79).....	909

INDUSTRIAL TRAINING.

Introduction	910
A socialistic view of the question.....	911
The practical party's view.....	912
Manual labor as manual training and as industrial training.....	912

I.—INDUSTRIAL DEPARTMENTS OF SCHOOLS FOR THE SPECIAL CLASSES.

Training in schools for the special classes.....	912
In schools for the deaf (Table 80).....	913
In schools for the blind (Table 81).....	916
In schools for the feeble-minded (Table 82).....	918
In reform schools (Table 83).....	919
“Industrial schools” (Table 84).....	921

II.—TRADE SCHOOLS.

The Williamson school.....	923
The Rindge school.....	924
Moral features of these schools.....	924
The Pratt Institute.....	925
The New York Trade Schools.....	926
Nautical school of New York City.....	926

CHAPTER XVI.—COMMERCIAL AND BUSINESS COLLEGES—NURSES' TRAINING SCHOOLS.

I.—COMMERCIAL AND BUSINESS COLLEGES.

General remarks	927
Summary of statistics of commercial and business colleges (Table 85).....	928
Statistics of commercial and business colleges (Table 86).....	930

II.—NURSES' TRAINING SCHOOLS.

	Page.
General remarks	940
Summary of statistics of training schools for nurses (Table 87)	941
Statistics of training schools for nurses (Table 88)	942

CHAPTER XVII.—EDUCATION OF SPECIAL CLASSES.

I.—EDUCATION OF THE DEAF.

General remarks	944
Notes from catalogues, returns, etc.	945
Summary of statistics of institutions for the deaf (Table 89)	947
Statistics of institutions for the deaf (Table 90)	950

II.—EDUCATION OF THE BLIND.

General remarks	962
Notes from catalogues and returns	962
Summary of statistics of institutions for the blind (Table 91)	964
Statistics of institutions for the blind (Table 92)	966

III.—EDUCATION OF THE FEEBLE-MINDED.

General remarks	972
Summary of statistics of institutions for the feeble-minded (Table 93)	973
Statistics of institutions for the feeble-minded (Table 94)	975

IV.—REFORM SCHOOLS.

Notes from catalogues and returns	978
Summary of statistics of reform schools (Table 95)	980
Statistics of reform schools (Table 96)	982

V.—EDUCATION OF THE COLORED RACE.

General remarks	988
Statistics of colored school population, enrolment, and average attendance (Table 97)	988
Comparative school statistics of the colored and the white race (Table 98)	989
Statistics of teachers in public schools for the colored race (Table 99)	989
Private boarding-schools	990
Character of the instruction	990
Statistics of schools for normal, secondary, and collegiate education of the colored race (Table 100)	991
Professional schools	992
Statistics of professional schools for the colored race (Table 101)	993
Statistics of colored pupils in schools for special classes (Table 102)	994
Synoptic view of the statistics of schools for the colored race (Table 103)	994
Industrial education	994
List of institutions for the secondary, superior, and professional instruction of the colored race	997

REPORT OF THE COMMISSIONER OF EDUCATION.

CHAPTER I.

EXECUTIVE STATEMENT.

Time Covered by the Statement—Work of the Division of Records—The Division of the Library and Museum—The Division of Statistics—Plan of the Present Report—Recent Publications of the Office—Opinions Respecting the Same—Education in Alaska Reviewed—The Colony at New Metlakahila—New Regulations and Amendments—Changes in the Territorial Board—Increased Appropriations for Alaska Needed—Change in School-Books Desirable—The Centennial of the Ohio Valley—Estimates for 1890-91—Quarters for the Office—Opinion of the National Educational Association—Description of a Suitable Building—Printing Done for the Office.

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., August 31, 1888.

SIR: I have the honor to submit the following report of the operations of this Office during the year ending June 30, 1888.

Its work has been conducted substantially in accordance with the principles indicated in my first and second Annual Reports, modified in such directions as further experience showed to be desirable.

The assignment of employés to three divisions, and their regular occupations with the duties required by law or by the usage and regulations of the Department, have proved eminently satisfactory.

THE DIVISION OF RECORDS.

The management of the written and printed correspondence of the Office, and the care of its records, are confided to the Division of Records.

During the year under review, 15,197 written letters and 240,000 copies of documents were sent out, besides more than 14,000 statistical inquiry forms; while 11,096 written letters, 12,000 statistical returns, 44,000 acknowledgments, and 6,913 documents (books and pamphlets) were received. One copy of each of these publications was sent to the library of the Office, and the others distributed to such correspondents as the character of the documents rendered proper.

In addition to these, the Office received from the Government Printing Office 172,799 copies of the reports and circulars of information printed for its use.

Continuing a practice established under my predecessor, the laborers assigned to this Bureau have two-thirds of the watchmen's duty, rendered necessary by its separate quarters, since the Department furnishes only one of the three watchmen between whom the twenty-four hours are divided. When the very low rate at which these faithful employes are paid is taken into account, I think that this arrangement requires more of them than corresponding employes in other offices are expected to do.

THE DIVISION OF THE LIBRARY AND MUSEUM.

The library of this Office contains one of the most valuable pedagogical collections in the country. The card catalogue has rendered the contents of this collection available, and, in consequence, the library is growing more and more useful every year. Its value is already known to educationists of every grade, and it has been used during the year by many persons engaged in the investigation of educational subjects. Inquiries upon these subjects are frequently made by correspondents, not only in the United States, but in foreign countries, for information which is nowhere else so readily obtained. In response to these inquiries, over five hundred cards giving references to investigators on various subjects have been prepared. Some of these cards were the result of much careful study, coupled with elaborate research.

The library now contains over twenty-one thousand volumes and eighty thousand pamphlets, besides many thousand duplicates, which are used for exchange or distribution. Of these duplicates about ten thousand have been disposed of during the year. Some were exchanged for books needed in the library, but the greater part of them were distributed among school and college libraries in various parts of the country.

During the year two thousand volumes and twenty thousand pamphlets have been added to the collection. The volumes have been catalogued and placed on the shelves and the pamphlets indexed and filed. The books in the library have been classified, rearranged on the shelves under subjects, and a Finding List of them prepared. The preparation of this list, which began June 16, 1888, necessitated the writing of about twenty thousand cards, the copying of fifteen hundred pages of manuscript, and the handling of all the books in the library.

In the foreign section of the library the books and pamphlets of thirty-one different countries have been classified, arranged on shelves, and catalogued. This work included the making of ten thousand cards, representing fifteen different languages, and the copying and composing of six hundred and fifty pages of manuscript. The French and German books have been classified and arranged on shelves, but

some revision of this list may be necessary before it can be copied. The list of the English books is about ready for the copyist.

In view of the importance of the library to the work of the Office, and the convenience which a catalogue of all of the books upon its shelves would afford, not only to the employés of the Office, but to those interested in educational literature throughout the country, it is important that this catalogue should be printed. The appropriations for the use of the Office are not sufficient for this purpose, and following the precedent which has obtained in regard to the libraries of other bureaus in the departments, I respectfully suggest that an appropriation be made by Congress for the purpose of printing and publishing the catalogue of this library.

The collection of college catalogues is the largest and most complete of any in this country, and constitutes a valuable part of the library. Many of these catalogues have been arranged chronologically by decades, or half decades, and prepared for the bindery. Over four hundred volumes have already been bound, while many more await completion preparatory to binding. The importance of binding and preserving these catalogues becomes a matter of great interest to educators, when it is remembered that many of our leading colleges do not possess complete sets of their own publications. Colleges frequently apply to this library for catalogues, or other publications to complete their sets.

The Museum of the Office has been enriched during the year by the accession of many articles, notable among which are a set of Langl's wall views of famous buildings, and a series of casts from antique gems illustrating the literature and history of Greece and Rome. Collections of this kind would be very valuable adjuncts to all instruction given in American schools and colleges.

In making additions to the Museum, I have been guided in all cases by the advice of eminent men actually engaged in the work of education, and personally cognizant of the contents and deficiencies of the collection.

If this Bureau were housed in a building suitable to its work, and capable of storing its collections adequately, I would urge the propriety of making its library a depository for every native book, and its Museum the depository of every native map, chart, engraving, print, or apparatus intended for use in schools or bearing upon educational subjects, and I should be pleased to have you consider the propriety of recommending to Congress such an extension of the patent and copyright laws as will require proprietors of such works to deposit copies in this Office for preservation as above indicated.

While the Office remains in temporary and inconvenient quarters, or exposed to the chance of removal to others yet less suitable for the discharge of its duties, this proposition is impracticable. But I feel it my duty to suggest it now and here, in order to bear my personal testimony

to what this Bureau might become if treated with the consideration that its objects and methods justify.

THE DIVISION OF STATISTICS.

To the Division of Statistics is confided the duty of preparing such parts of the Annual Reports and other publications of the Office as do not require the constant personal attention of the Commissioner. When the general plan of a document has been settled in detail, the collection of facts, the construction of tables, the composition of text, and the correction of proof may be devolved on a corps of trained employes working in the charge of a competent chief, who is always in consultation with the head of the Office.

I have insisted ever since I took charge of the Bureau, that before all other duties, it must prepare an Annual Report upon the condition of education in this country. Consequently, the preparation of a very large part of the Annual Reports has been the principal labor of this division.

Two employes have been constantly occupied in the preparation of the Special Report on Education in Fine and Industrial Art, of which a description is given below.

In addition to the preparation of these documents, the employes of the Statistical Division have read the proof of all reports and circulars issued by the Bureau since my assumption of the Commissionership. Whenever necessary, they have also prepared the tables of contents and indexes necessary thereto and have thus added much to their practical usefulness.

I can not conclude this brief account of the division and their work without stating briefly the idea upon which I have proceeded. I have always believed that every piece of work, suited to the ability of the performer, and honestly accomplished, is directly educative in its influence, and I have therefore tried in assigning workers and work to produce an improved condition among the employes under my direction, and I have good reason to believe that they have been personally benefited by my course in this matter, much to the profit of the service.

PLAN OF THE PRESENT REPORT.

The general features of this volume resemble those of the document for last year. I have thought it advisable, however, to transfer the subject of public high schools from the chapters respecting secondary instruction to those which relate to city school systems, in order to make the treatment of public school affairs more complete and systematic. If the same course is pursued hereafter, public kindergartens will eventually be treated with other public schools.

The very full classified statistics of public libraries in the last Report are omitted from this volume, as is, also, the subject index to the earlier

publications of the Office. The space thus gained has been given to the consideration of other parts of the general subject. My two previous Annual Reports, especially the last, indicate the general direction in which I am moulding the details and shaping the contents of this volume. Simplicity, unity, consistency, and due brevity have been the objects sought to be attained. I am confident that this volume will be found more concise, more logical, and more comprehensive than its immediate predecessor.

In addition to the permanent topics which should be considered every year, researches in special directions have been prosecuted; these will be continued or replaced by others as propriety or opportunity dictates. In this way I hope to preserve the continuity essential to a series, while giving each document some marked individuality of its own.

I reserve further remarks about the contents of this volume for Chapter II.

RECENT PUBLICATIONS OF THE OFFICE.

I take this occasion to recapitulate the documents issued by this Bureau since I assumed charge of it, in the month of August, 1886. And first as to—

(A) Documents left unfinished by my predecessor, which have been completed in accordance with his designs, but printed and distributed during my incumbency, as set forth in each case:

(a) The Annual Report for 1884-85. One hundred and four pages of tabular and index matter were compiled, and 158 pages, completing the document, were printed.

(b) Circular of Information No. 1, 1886: Study of Music in Public Schools; 20 pages added, and the whole, 78 pages, printed.

(c) List of Libraries in the United States, 96 pages; tabulated and printed.

(d) The Special Report on Educational Exhibits and Conventions at the New Orleans Exposition of 1884-85, 964 pages; printed from the plates.

(e) The Special Report on Indian Education and Civilization, 693 pages; 100 pages added, the whole revised, set in type, stereotyped, and printed.

(B) Next as to documents undertaken and completed entirely during my term of office.

(a) The Annual Report for 1885-86, 813 pages.

(b) The Annual Report for 1886-87, 1,170 pages.

(c) Circular of Information No. 2, 1886: Proceedings of the Department of Superintendence of the National Educational Association for 1886, 91 pages.

(d) Circular of Information No. 1, 1887: The College of William and Mary, 89 pages.

(e) Circular of Information No. 2, 1887: The Study of History in American Colleges and Universities, 299 pages.

(f) Circular of Information No. 3, 1887: Proceedings of the Department of Superintendence of the National Educational Association for 1887, 200 pages.

(g) Circular of Information No. 1, 1888: Thomas Jefferson and the University of Virginia, 308 pages.

(h) Circular of Information No. 2, 1888: History of Education in North Carolina, 180 pages.

(i) Circular of Information No. 5, 1888: Industrial Education in the South, 86 pages.

(j) Circular of Information No. 6, 1888: Proceedings of the Department of Superintendence of the National Educational Association for 1888, 165 pages.

The foregoing items, when consolidated, show that since August, 1886, this Bureau has printed 1,771 pages of matter on hand at that date, and collected, compiled, and printed 3,621 other pages of matter, a total of 5,392 octavo pages. About 2,000 of these pages are printed in solid brevier.

(C) Lastly as to documents unfinished at the present writing.

(a) This present Annual Report, for 1887-88, which will shortly be completed, except the index.

(b) Part II of the Special Report upon American Education in Fine and Industrial Art; this work was undertaken in response to a resolution of the U. S. Senate, dated February 2, 1880; Part I—Drawing in Public Schools—was first printed in 1885 as a Senate document; next, to the number of 250 copies, in 1886, on requisition of this Bureau; and lastly in 1887, to the number of 5,000 copies, by concurrent resolution of Congress.¹ Part II is mainly devoted to an account of the movement for industrial training which is at present attracting so much attention, not only in the United States, but throughout the civilized world. It is treated in this volume with especial reference to the question of its adoption by the public schools throughout the United States. The delay in the issue of Part II has compelled considerable change in the original plan, since the movement has so rapidly developed. This work is still in charge of Mr. I. Edwards Clarke, by whom it was begun.

(c) Circular of Information No. 3, 1888: History of Higher Education in South Carolina; at the Printing Office.²

(d) Circular of Information No. 4, 1888: History of Education in Georgia; at the Printing Office.²

¹The edition of 1885 was entitled "Instruction in Drawing applied to Industrial and Fine Arts;" that of 1886 was called "Industrial and High Art Education in the United States;" and that of 1887, "American Education in Fine and Industrial Art."

²Printed and distributed before the issue of the present Report.

(e) Circular of Information No. 7, 1888: History of Education in Florida; at the Printing Office.¹

(f) A monograph on the History of Higher Education in Wisconsin; at the Printing Office.¹

(g) A monograph on the History of Higher Education in Indiana; at the Printing Office.

(h) A monograph on the History of Federal and State Aid to Higher Education in the United States; at the Printing Office.

(i) A monograph on the Teaching and History of Mathematics in Secondary and Superior Schools; at the Printing Office.

In the second chapter of this Report I present a full account of the reasons for undertaking these historical publications, of the progress in detail to date, and of the plan as a whole. I would state here, however, that in addition to those mentioned above as having been already published or sent to the Printing Office, there are now in course of preparation, and will be rapidly made ready for the press, monographs on the history of education in Ohio, Illinois, Michigan, Kentucky, Tennessee, Alabama, Mississippi, Louisiana, Texas, Arkansas, Kansas, Missouri, Iowa, Minnesota, Nebraska, Nevada, California, Colorado, Oregon, Maine, Massachusetts, New Hampshire, Vermont, Connecticut, Rhode Island, New York, New Jersey, Delaware, Pennsylvania, Maryland, and the District of Columbia. The cost of preparation has already been provided for out of the appropriations of the Office.

It will be seen at this writing, that besides this volume the Bureau is pushing, either through the press, or to completion with that purpose in view, one special report, and thirty-nine circulars of information. These publications will probably cover at least five thousand octavo pages.²

¹ Printed and distributed before the issue of the present Report.

² I venture to quote here a few testimonials as to the quality and value of the publications of the Bureau, selected almost at random from the many that have been received.

"Especially important among these publications are the large Annual Reports, the comprehensiveness of which arrests our attention. These Reports give, most completely, a general view of school affairs in the several States of the Union, and of all important changes made, matters of discipline, instruction in hygiene, and school architecture. Not only is the educational condition of the United States thus comprehensively covered, but the course of educational affairs in every civilized country is followed with an attention greater than that which we, here in Germany, are accustomed to give, depending, as we willingly do, upon the supposed excellence of our own system, an excellence that, we believe, continues to fill foreigners with envy.

"Besides these classically edited reports, as they may well be called, the Bureau publishes numerous smaller works of value."—Dr. H. G. WEISKE, *Editor Zeit. für das höhere Unterrichtswesen, Leipzig.*

"I shall esteem it a great favor if you can send me, from time to time, copies of your valuable "Circulars of Information." While holding the office of Minister of Edu-

EDUCATION IN ALASKA.

The public schools established and conducted under the supervision of this Office, and the management of the Territorial Board of Education of Alaska, are believed to have done as much good work as the means available for their support permitted.

There have been 15 public free schools in operation during the year, besides a public day school at Anvik, conducted by the missionary society of the Protestant Episcopal Church, and one each at Bethel and Carmel, conducted by the Moravian Church; also two industrial training schools, two schools on the Seal Islands maintained by the Fur Seal Company, two wholly supported by religious societies in the United States, and 17 deriving their support, their teachers, and their inspiration from the Russian Government through the Orthodox (established) Church of that Empire.

The two industrial training schools were formerly supported from appropriations for "Indian Education" disbursed and controlled by the Office of Indian Affairs. This division of control and responsibility was deemed unnecessary, and Congress consolidated the appropriation for this purpose with that for the support of other public schools in the Territory, so that all public moneys for educational purposes in Alaska during the current year have been disbursed under the supervision of this Bureau.

This is, I think, a judicious change. The so-called "Indians" of Alaska are not Indians in the sense in which the term is applied elsewhere in the United States. They are, like the other inhabitants of Alaska, self-supporting, and many of them are anxious to receive the training needed to fit their children for the duties and responsibilities of American civilization.

cation here, I derived great assistance from them, and am of the opinion that they exercise an important influence over educational affairs generally throughout the world."—Hon. JOHN A. COCKBURN, *Adelaide, South Australia*.

"I have seen a copy of the Report for 1886-87, and consider it the most valuable Report the educational department has published."—A. R. WINCHELL, *State Chemist of West Virginia*.

"Many interesting data I can glean from the precious and valuable work, Report of the Commissioner of Education for the year 1885-86."—Prof. LADISLAUS LECHNER, *of the Royal Gymnasium in Buda-Pesth, Hungary*.

"I greatly admire the Report for 1886-87. Its scope and arrangement charm me."—President H. A. CRANE, *of Nebraska Central College*.

"I have given your Report for the year 1886-87 a careful examination, and I now beg leave to say that in my estimation the document is one of the most valuable and wonderful it has ever been my privilege to consult. The patience, faith, industry, intelligence, and intrepidity necessary to the production of such a mine of information command my highest admiration. As one of the many who are to reap the benefits of this compilation, please accept my hearty thanks. The index at the close to the varied topics treated by issues from your department, is valuable in the largest degree."—Rev. ARTHUR EDWARDS, D. D., *editor of the North-Western Christian Advocate, Chicago*.

The morals of these people have been painted in the most disgusting colors by sensational tourists, who have very little opportunity of knowing the truth of their statements. The testimony of those who have lived among these people reveals a different condition of their morals. In general, the state of society is not worse than that of tribes nearer the centres of civilization. It is the repetition of the same story of civilized men coming in contact with races of inferior or partial civilization. It has always existed and will always exist. This state of depravity can only be improved by a thorough moral and intellectual intercourse and association with the better class of American citizens.

New Metlakahla.

I am happy to be able to state that the fugitive people from British Columbia, who have been converted from barbarism to civilization by Mr. William Duncan, and who removed to Annette Island in the Alexander Archipelago on account of disputes with the colonial authorities, civil and ecclesiastical, have made fair progress during the year in establishing themselves in their new home.

The island occupied by these people is about seven miles long and about one mile wide.

They have cleared, drained and prepared the land, constructed houses, and organized their affairs. A year ago, Mr. Duncan, their beloved and trusted leader, was commissioned as a magistrate by the Governor of Alaska, so that they might not lack the presence and protection of American law. They are now building houses for the accommodation of two boarding schools, with rooms for the requisite teachers, one of whom is to be a capable farmer and gardener. In other ordinary occupations they are already trained by the wise forethought of their leader, Mr. Duncan.

Their day schools during the year contained from sixty to one hundred and ten pupils; this number will probably be increased during the current year by the attendance of pupils from neighboring villages.

The following extract from a recent letter from Mr. Duncan may prove of interest:

We have just celebrated our first fourth of July in our Alaskan home. Our people kept the day in a truly loyal spirit. In holiday attire they assembled around the flag-staff in the morning. The flag was hoisted and duly saluted from our small cannon, and the brass band played appropriate airs. The children of the village, each with a flag in hand, marched and sang school songs. Canoe races and other games followed. In the evening the children were served with cakes and raisins, and adults, male and female, met in the school-room to partake of cakes and lemonade and to give expressions to their loyal feelings. Seven stirring speeches were made honoring the day, calling upon all to take fresh courage and quicken their speed.

I would respectfully recommend that a post-office be established at Metlakahla for the benefit of the colony. It contains now over one thousand inhabitants, and is the most important of the towns built up

by the native population. It is extremely desirable that these people should be provided with good mail facilities, not only on their own account, but also on account of the growing importance of this point to the future interests of the Territory.

New Regulations for Alaskan Schools.

The rules and regulations for the conduct of public schools in Alaska promulgated by your predecessor June 14, 1887, and published in my Annual Report for 1886-87, have proved, as a whole, wise and effective. Experience, however, has shown some points wherein they can be improved. The changes and additions found advisable were approved by you August 15, 1888, and are here printed to complete the record in this direction.

Amendment of Section 2 of Part 1.

The second paragraph of Section 2, Part 1, of said Rules and Regulations is amended so as to read as follows: The Governor of the Territory, the Judge of the United States Court, and the General Agent of Education in Alaska, for the time being, with two other persons, to be appointed by the Secretary, upon the nomination of the Commissioner of Education, shall constitute the Board of Education, and the General Agent of Education shall be the Secretary of said Board, and shall keep the record of its proceedings. Three members shall constitute a quorum of said Board.

Additional Rules.

SECTION 1. All missionary, boarding, or other schools, conducted by private persons or under the supervision of any of the Christian churches, which shall receive aid and assistance from the Government, shall be subject to the visitation and inspection of the Board of Education, who shall have power to see that proper discipline is maintained and instruction given, and wholesome food and proper clothing and comfortable lodging furnished to the inmates of such school.

SECTION 2. The Board of Education shall have power, and it shall be its duty, to prescribe courses of study for the several schools under its jurisdiction, and particularly to prescribe what shall be the extent and character of the industrial instruction to be given in any or all of said schools, and the teachers of said schools shall conform as nearly as practicable to the courses of study prescribed by the Board. This rule shall include such schools as receive aid from the Government.

SECTION 3. Corporal punishment shall not be excessive and shall be inflicted upon pupils in attendance upon the public and other schools only in extreme cases, and then in moderation. Any teacher who shall violate this rule shall be subject to removal and loss of pay. The Board of Education will enforce this rule rigidly, and report all violations to the Commissioner of Education.

SECTION 4. Any action taken by the Territorial Board of Education under the preceding rules shall be subject to the revision and approval of the Commissioner of Education.

Changes in the Territorial Board.

It is proper to add that in compliance with the terms of the amendment above recited, the Hon. James Sheakley, of Fort Wrangell, and Mr. William Duncan, of New Metlakatla, have been appointed members of the Territorial Board of Education.

Increased Appropriations for Alaska needed.

Justice to the different parts of the Territory requires that more schools should be opened, more school buildings erected, more supplies purchased, more teachers employed. I respectfully urge the propriety and equity of granting a substantial increase of appropriations for these most worthy objects. During the twenty-one years that have elapsed since the contract with the Alaska Fur Seal Company was made, that corporation has paid a rental into the Federal Treasury of \$55,000 per annum, or an aggregate of \$1,155,000, besides the much greater sum realized from the royalty on every seal taken.

Surely the expenditure of a fair share of this money for the training of the native inhabitants of the Territory in the habits and industries of American civilization will be both just in the present and wisely provident for the future.

Change in School-Books.

The experience of teachers in Alaskan schools emphasizes that of the teachers in Indian schools as to the unsuitable character of ordinary text-books. General S. C. Armstrong, of the Hampton Normal and Agricultural Institute, one of the wisest men engaged in the work of Indian education, has expressed his readiness "to advocate the preparation, by competent persons, of a set of school text-books for Indian schools." Mr. Arthur Grabowski, principal of Haskell Institute, says that the text-books used in Indian schools are as little adapted to the wants of the pupils as French books would be. I concur in these opinions as to Alaska also, and would suggest the propriety of taking measures whereby suitable books may be prepared by a committee of competent persons, published by arrangement with some respectable firm, and used exclusively in all Indian and Alaskan schools. These books need not cover the whole field of public education; they should, however, provide for the beginnings of work in each of the elementary branches, and be carefully adapted to the surroundings of Indian life and the peculiarities of the Indian child.

THE BUREAU'S CONTRIBUTION TO THE OHIO VALLEY CENTENNIAL.

In compliance with your desire that the several offices of your Department should make, at the Centennial Exposition of the Ohio Val-

ley and Central States, as extensive and creditable a display of their specialties as the brief time and limited funds at their command would permit (the exposition being announced to open in Cincinnati on the fourth of July), this Bureau, under instructions from Mr. Marcellus Gardner, your representative in charge of the Department's exhibit, prepared and forwarded in the latter part of June a varied assortment of articles from its museum, books from its library, and statistical charts compiled from the most recent information in its possession. Dr. A. P. Bogue, a clerk in this Bureau, who had served in connection with the Bureau's exhibits at the Philadelphia Centennial of 1876 and the New Orleans Cotton Centennial in 1884-85, was detailed for similar duty under Mr. Gardner in Cincinnati.

For general distribution at this exposition a little eight-page "folder" was compiled by Mr. John W. Holcombe, Chief Clerk of the Bureau, which briefly set forth the purpose, history, and organization of the Office, the number and character of its publications, and the part it had taken in previous exhibitions, native and foreign. This leaflet describes the exhibit at Cincinnati as follows:

"The effort of the Bureau of Education is confined strictly to setting forth its own organization, methods of doing business, and the results of its labors. Several specimen file-cases, index books, and letter-press books indicate the system of managing the records and correspondence, while a few large cards display selected statistical tables. A complete set of the publications of the Bureau is shown in thirty-three bound volumes, together with samples of reports, circulars, and bulletins, in the cloth or paper covers in which they are distributed. In six cases taken from the thirty in the museum is placed a selected display, which is intended to indicate the character and variety of the Bureau's collections. From the library is sent a representation of general educational literature; of educational reports of States, cities, and institutions, bound or filed in boxes; and of foreign educational literature and reports. The diplomas won at previous expositions, and a few selected pictures, complete the exhibit."

ESTIMATES FOR 1890-91.

I have repeated the estimates made last year for the service of the Office.¹

¹ At the meeting of the Department of Superintendence of the National Educational Association, March, 1889, a committee appointed to inquire into the needs of the Bureau of Education and the means necessary to increase its efficiency made the following report:

"The special committee to whom was referred the need of legislation to increase the efficiency and usefulness of the Bureau of Education, beg leave to submit the following report:

"The act of Congress creating the Bureau as an independent Department of Education, and intrusting its management to a Commissioner with a salary of four thousand dollars, was passed March 2, 1867.

"In 1869 a strong opposition to the new Department of Education manifested it-

With respect to the estimate for education in Alaska, I have added to the estimate previously submitted the amount usually appropriated for the support of industrial schools for Indians in that Territory, since it is proposed to transfer the support and supervision of these schools to this Bureau.

QUARTERS FOR THE OFFICE OF EDUCATION.

In my last Report I stated the reasons why the transfer of this Office to the Pension building, as required by the Act of Congress of March 3, 1887, would be injurious to its work, its collections, and its usefulness. Time has only confirmed the opinions I then expressed.

I am glad that this Act has been repealed, and that the Office will be allowed to remain in its present quarters.

The Office is under great obligations to you for the steps you took to prevent the proposed change, and I feel that the repeal of this legislation is mainly due to your personal efforts, as expressed in your letter

self, in Congress, and the act creating it was so amended as to reduce the Department to the subordinate position of an 'Office of Education,' in the Department of the Interior, and to make the management of the Office, by the Commissioner, 'subject to the direction of the Secretary of the Interior,' and the annual salary of the Commissioner was reduced to three thousand dollars.

"Under those unwise limitations the Bureau of Education has been conducted for nearly twenty years, and the fact that it has been able to render such valuable service to the cause of education is due largely to the fidelity and self-sacrificing spirit of the men who have filled the position of Commissioner. Few realize the embarrassments which have beset the duties of the Office, and fewer know how greatly its possible efficiency has been lessened by the lack of official appreciation and adequate pecuniary support.

"But in spite of all limitations and embarrassments the Bureau of Education has fully justified the wisdom of its creation. Its great value as an educational agency of the General Government is no longer questioned by anyone who knows its history and work. It has not only furnished needed assistance to those intrusted with the organization and conduct of schools and school systems, but it has from time to time responded to the call of Congress itself for valuable information on school affairs.

"It is believed that the time has now come when the Bureau of Education should be restored to its original position as an independent Department, and its management be again intrusted to the Commissioner in charge. The salary of the Commissioner should be increased to not less than five thousand dollars—the present salary of the Commissioner of Labor, and the recent salary of the Commissioner of Agriculture. The position of the Commissioner of Education never can assume its proper dignity at the seat of government so long as the Commissioner is obliged to live on the present salary, and it is certainly too much to ask the Commissioner to supplement this salary by his private means.

"The Department of Education should receive an annual appropriation sufficient for the efficient discharge of the important duties intrusted to it, and all its reports, circulars, and other information respecting educational progress should be promptly published and distributed. The practical value of the successive Annual Reports of the Bureau has been greatly lessened by their tardy issue and circulation.

"It is recommended that a committee be appointed by this body to memorialize Congress to these ends, and, if possible, secure necessary legislation.

"It is also suggested that this committee make an effort to secure such supervision of the education schedules in the next decennial census by the Commissioner of Education as will result in more accurate and valuable statistics in this department."

of July 30, 1888, which I insert here for the purpose of putting upon record the reasons against such a change as was contemplated in the Act of March 3, 1887:

DEPARTMENT OF THE INTERIOR,

Washington, July 30, 1888.

MY DEAR SIR: I observe by the sundry civil bill, as it has been reported by the Committee on Appropriations to the Senate, the only repeal of the act of March 3, 1887, which required the removal of the General Land Office, Bureau of Railroads, and Bureau of Education to the Pension building, provided for is so much as relates to the Land Office.

I do most sincerely think it will be a serious injury to the Educational Bureau and also to the Pension Bureau to compel the removal of the former into the Pension building. It can not but practically strangle the Bureau of Education for a considerable period at least, and I can not see but that it must seriously interfere with its usefulness so long as it shall remain there. There are now about forty-three clerks and people employed in the Bureau of Education, and they have a large collection of books, models, educational appliances, and bric-a-brac of various character and all contributory to enlightenment. I have visited the Pension building and can not see how this can be stored, except in great part in the fourth story. Practically, it becomes when placed there unavailable for use.

The appropriation in the legislative, executive, and judicial bill on account of the Bureau of Education is, all together, \$50,920. The rent of the building to be saved by this change is \$4,000. In order to save this sum of \$4,000 of rent, I do not hesitate to say that this action will waste \$25,000 of the appropriation for the Bureau.

I have heard the idea expressed in casual conversation that the Bureau of Education was not an instrumentality of especial value, and I fear that this idea has had something to do with the willingness to cripple it by this removal.

I do not concur at all in the sentiment; but if the sentiment is to have any influence, and especially under the plea of economy, it should take an effective direction to accomplish the latter end; and this would require that, in case of this removal being insisted upon, a great part of the force should be discharged and the appropriation made for the conduct of the Bureau diminished. I do not doubt that it could be diminished one-half, upon the theory of the removal, and as effective work be accomplished as if the same number of officers and employes shall be retained now provided for, because they can not work to advantage in such quarters as can be assigned in the Pension Bureau.

The legislative bill has made provision for the rent of the building now occupied by the Bureau of Education only until the 1st of December next, appropriating \$1,667 for the purpose, one-third of the annual rental. The time is short and the pressure upon Congress, and especially upon you, my dear sir, I recognize to be very great at this juncture. Is it not the part of wisdom to continue that Bureau where it is for the remainder of this fiscal year, which will involve but \$2,333 more (perhaps less than the cost of its removal), and review this subject at the next session with more attention than can now be allowed to it?

If it be possible for yourself, or some member of the committee, to give an hour or an hour and a half to a personal examination of the circumstances, I feel convinced you will recognize by a survey of the buildings and the property involved the imperative urgency and the wisdom of the suggestion I venture to make.

The provision for the post-office within the area of the Pension building will make that building as thoroughly occupied as almost any Government building in the city, perhaps quite as much.

I have the honor to be, my dear Mr. Chairman,

Very respectfully, your obedient servant,

WM. F. VILAS,
Secretary.

HON. WILLIAM B. ALLISON,

Chairman Committee on Appropriations, United States Senate.

Opinion of the National Educational Association.

In connection with this subject, I would respectfully call your attention to the views of the National Educational Association of the United States, as expressed in the following memorial, adopted at the session in San Francisco, Cal., July 17-20, 1888.

Whereas, The Bureau of Education at Washington City has been the means of rendering efficient service in the cause of popular education in the United States, and of collecting the largest educational library in the world, as well as one of the most complete pedagogical museums; and

Whereas, Those collections are now preserved in rented rooms wholly inadequate to meet the growing demands of the Bureau; therefore, be it

Resolved, That in order still to further the work for which the Bureau was organized, this body, representing all of the States and Territories, here assembled, does most respectfully petition the Congress of the United States to erect a suitable building to be used exclusively for the benefit of the Bureau of Education.

Resolved, That copies of these resolutions be forwarded to the President of the Senate and to the Speaker of the House of Representatives, with a request that the same may be laid before the bodies over which they respectively preside.

The National Educational Association was organized in 1857, by leading teachers from all sections of the country, and includes in its membership the most influential educators of the Union.

It now represents over three hundred thousand teachers and persons interested in the public schools and higher education.

Its wishes are certainly entitled to respectful consideration, as the interest it represents is of the highest importance to the public welfare.

A Suitable Building for the Bureau.

The experience of many years guides us to a correct determination as to the character of the quarters in which an Office like this Bureau can be located to the best advantage. Such quarters should comprise:

(1) A basement story, containing two large rooms for the storage of the publications of the Bureau, and several smaller rooms for the fuel, the heating apparatus, packing of documents for the mail, carpenter's shop, etc.

(2) A principal story, containing, in front, the main entrance to the building, and rooms for the Commissioner, chief clerk, stenographers, mail clerks, records and files, and the reception of visitors, and opening in the rear into two much larger rooms, in which the library and the museum should be kept; these two rooms should be equal in height to two stories of the front.

(3) A second story, containing rooms for clerical and statistical work; from the rearmost of these the galleries in the library and museum halls might be entered.

The most convenient form for this building would be three sides of a parallelogram, where the free sides would project rearward and contain the large rooms just described, and the third side would constitute the front, contain the smaller rooms mentioned, and unite the other sides structurally and conveniently.

The large rooms for the museum and the library should be made substantially like the rooms used for those purposes in the building recently erected for the Army Medical Museum and Library; the smaller rooms should not exceed in area eighteen by twenty-four feet and should have their longer sides facing the outside of the building; the clear height of the basement need not be more than ten feet, of the first story fifteen feet, and of the second story fourteen feet. If the basement level is fixed at six feet below that of the street, the walls including cornices need not be more than forty feet high. The halls for the library and the museum should each have an area of about three thousand feet; they could be sufficiently separated from each other on their inner flanks by a paved court or passage about ten feet wide. The front part of the building above the basement could conveniently contain ten rooms on each of its two stories, with convenient halls and stairways; and the ground covered by such a front need not be more than sixty-five hundred square feet. Such a building could be conveniently and economically constructed on a lot one hundred and seventy-five by one hundred and twenty-five feet, which would allow sufficient space for air, light, cartways, etc. The present quarters of the Bureau, which are barely sufficient for its present needs, occupy a lot about sixty by fifty feet, and the building is about sixty-five feet high above the sidewalk. If the front of the suggested building were constructed of brick, with iron beams and brick floors, and if the wings above the basement were constructed mainly of brick piers with iron frames and glass panels, it need not cost more than sixty thousand dollars; the rent paid for its present quarters is four per cent. on seventy-two thousand dollars.

EXPENDITURE OF THE BUREAU'S FUND FOR PRINTING.

I also beg to call your attention to the manner in which the money allotted by the Interior Department for the printing of this Office has been expended.

For the fiscal year 1886-87, out of the sum of \$340,000 appropriated by Congress for the printing of the Interior Department, the sum of \$21,405.42 was allotted to the Bureau of Education by the Secretary of the Interior. Of this amount, so allotted, \$15,007.28 was expended for the printing of this Office up to June 30, 1887, leaving a balance of \$6,398.14 in favor of the Bureau.

Upon a statement of these facts presented to him November 2, 1887, the First Comptroller of the Treasury decided, in a letter of the same date, that work ordered by the Office, and approved by the First Assistant Secretary in May, could and should be paid for out of the appropriation for 1886-87, though not actually performed until after June 30, 1887.

In like manner, the allotment of this Office for 1887-88, made by the Secretary of the Interior, was \$18,681.54, and on June 30, 1888, but

\$10,670.91 had been expended, while there was in the Public Printer's hands considerable unfinished work ordered previous to that date.

For 1888-89 the allotment of the Bureau is \$18,107.98, and I am informed that the Public Printer has charged against this sum, up to the 1st of March, the amount of \$16,551.19 on work—most of which was ordered by this Office during the year ended June 30, 1888, while no work ordered by this Office since that date has been completed, and but one circular, which is estimated to cost only \$830, has been begun. Less than one-half of the above amount (\$16,551.19) charged against the allotment for the present year is made up of estimates for work ordered within this year, the remainder being charged for work ordered and contracted for in the preceding year, and intended to be paid for out of the allotment for that year, which was amply sufficient for the purpose.

This results, I am informed, by cancelling at the close of each fiscal year the balance standing in favor of the Bureau, without regard to the fact that much work already ordered or contracted for remains unfinished, or not begun, and then afterwards charging the completion of such work against the fund for the next year. These proceedings work great injustice to this Office, and I beg leave to protest against them through you most earnestly and emphatically. From these causes circulars of information which have been prepared and sent to the Printing Office during the fiscal year, have remained untouched while there were abundant funds due to the Bureau to complete the same, and were afterwards charged to the fund of the succeeding year, thus causing a total loss of the balance to the credit of the Bureau at the end of the fiscal year.

During the three years enumerated the aggregate amount allotted to this Bureau, as shown above, was \$58,194.94, and the amount expended was \$42,229.38, leaving a balance unexpended of \$15,965.56. The consequence has been exceedingly unfair and injurious to the work of this Office, and has resulted in the total loss of nearly one-third of the amount allowed it for printing its publications. Work that has been in the Printing Office for months has been allowed to go unfinished while the funds were abundant, and when completed during the succeeding year, has been charged against the fund for that year.

I would respectfully bring this matter to your attention, and urgently recommend that some legislative remedy be devised by which the amount allowed this Office for printing shall not be used for other offices in the Department at the expense of the work and usefulness of the Bureau of Education.

CHAPTER II.

THE COMMISSIONER'S EDUCATIONAL STATEMENT.

The American Public School System—Condition of Public Education in the South—Facts Revealed by the Census of 1880: Adults and Minors in 1880, North and South; Wealth and Minor Population in 1880, North and South; Density of School Population in 1880, North and South; Condition of Industry in the South—Sources of School Revenue—The Record for the Year—Manual Training—The History of American Education: History of Education in Virginia; in North Carolina; in South Carolina; in Georgia; in Florida; in Indiana; in Wisconsin; Object of this Series of Monographs; History of Federal and State Aid to Higher Education.

THE AMERICAN PUBLIC SCHOOL SYSTEM.

I desire to record my unqualified adherence to the educational policy rightly known as the American common school system. No other system of education for the masses has been so fruitful of good to the people of any country. It is a system wisely provided by the people, and if the liberties of the country are to be preserved in their purity, it will be due in a great measure to the intelligence resulting from its adoption and influence. Nowhere else in the world is there so much general information and as much knowledge in regard to public affairs as in the United States.

The youth is early inspired by the examples of patriotism which are taught him in the school-room, and upon his entrance upon life is thus prepared for the high duties of citizenship.

This system of free public education is the palladium of our liberties, and its maintenance is the highest duty of the State. The public safety rests upon the intelligence of the citizen, and all the power of the State should be directed in extending the facilities of education. No public man at this day will deny the duty of the State to provide a system of free public schools for its children. Our institutions rest upon the basis of universal suffrage, and the intelligence of the citizen based on universal education is as necessary to preserve them as personal liberty is essential to their enjoyment. Universal education and universal suffrage are new developments in political economy, and are twin sisters travelling upon the same lines, depending the one upon the other for the

success and enjoyment of their blessings. Education should be afforded without price, and should be as free as the water we drink or the air we breathe. It should be confined within no narrow limits, and should be bestowed upon all the children of the country without distinction of race or condition. When each State in this Union shall have provided a system under which a school is found in every hamlet this grave public duty will be partly discharged; but not until all of the blessings flowing from such a system are brought within the easy reach of the entire youth of the country will it be fully discharged. The maintenance of such a system by taxation is as much the duty of the State as the support of the judicial, legislative, and executive branches of its government. All are equally essential to the well-being of the commonwealth. The care of the State is extended to the dependent classes, and is equally due to all of its children. Money expended in the support of these schools is bread cast upon the waters that will bear fruit tenfold in the happiness it will bestow upon the citizen and in the strength it will give the State. Private agencies may supplement but can never supercede the necessity for their support from the public revenues.

This system has taken root in all the States of the Union, and has become an essential feature in their autonomy. It has engrafted itself upon their policy and is provided for in their constitutions. Happily the system is growing with their growth, and receiving increased encouragement and support. Their action accords with the utterances of that great revolutionary patriot, Francis Marion, who, when speaking of the necessity of public education, said, "It is plainly the first duty of the government to bestow it freely upon its citizens."

I repeat what I have said heretofore, that a wise administration of the laws and the maintenance of order and happiness rest upon the virtue and intelligence of the citizen; that therefore the education of the people is one of the highest duties of the State, and that no subject is more worthy the consideration of the enlightened statesman. The public school system is also the common fountain from which the higher institutions of education draw their maintenance, and no step backward should be taken either in perfecting its excellence or in extending its usefulness.

In the language of another: "When the common school system shall have unfolded all its vast powers; when a corps of trained and educated teachers to supply all its demands shall have taken the field; when the text-books used in the schools shall be wisely selected, and the school-house built upon the most approved model; when its protection and progress shall be the first object of the government—then will all its mighty agencies to do good be felt; the public mind refined and enlightened; labor elevated, patriotism purified; our republican form of government fixed on an immutable basis; and the people crowned with its benefits and blessings."—[Gov. Andrew G. Curtin.]

CONDITION OF PUBLIC EDUCATION IN THE SOUTH.

In considering the condition of public education in the Southern States great allowance should be made for the difficulties, both political and social, through which they have passed during the last twenty years; the trials of war, loss of property, and pride and prejudice of race, have all had to be surmounted.

Time alone can change such conditions, and time only can remove sentiments which are their natural outgrowth. Many and notable have been the experiences of these years in the political life of these States.

This is but a short period in the life of a people, and is too brief a span in national life for the successful solution of great social and political problems.

It would be idle, therefore, to expect in the Southern States the same growth and results that have been accomplished where the system has been in uninterrupted operation for two centuries and the social fabric and civilization have not been disturbed by the rude hands of war, or political or social revolution. There perfection should be expected and should create no surprise. Few people who have passed through the same trials have recuperated as rapidly as the Southern people, or have adapted themselves more readily to their new conditions and addressed themselves with more fidelity and energy to the renovation of their social life and material industries.

This is eminently true of their school systems. They have directed their efforts to bestow the advantages of education equally upon the children of the two races, upon the principle that it is a duty, and that universal education alone will avert the ills of universal suffrage. They fully believe that true liberty is measured by intelligence, and that the civilization of the white man can be made valuable to the black man only through the agency of public education, and that without education good citizenship is hardly attainable. While they admit the defects in their systems of public education, and make no effort to disguise them, they know that Southern education has always had, and still has, some excellent features peculiar to itself.

With all the difficulties surrounding this subject a most gratifying improvement has taken place in their educational affairs during the last decade. Some of these States now expend one-third of their revenues in the support of their free public schools.

The reorganization of their system of public education grew out of the complete enfranchisement of the colored race, and became necessary in order to adjust their new political relations to this race under the amendments to the Constitution of the United States.

The difficulties which beset the race problem may best be understood when it is remembered that no light broke upon Thomas Jefferson through the gloom in which his mind was involved when considering the subject.

While an advocate of universal emancipation, he could not reconcile himself to the idea of the two races living side by side upon terms of equality "in political rights, duties, and powers." The result of his reflections was summed up in the words, "nothing is more certainly written in the book of fate than that these people are to be free; nor is it less certain that the two races, equally free, can not live in the same government." He was incompetent to grapple with the last proposition, and dismissed it from his thoughts as a practical question, with the hope, "under the auspices of heaven," for the emancipation of the black man.

Within less than one hundred years the dream of Thomas Jefferson has been more than realized in the complete emancipation of the black man, and in his admission to all the rights of citizenship under the constitutions of the States and the United States. It was a step attended with danger and difficulty, and many of the strongest advocates of emancipation doubted the wisdom and policy of conferring upon him the right of suffrage in his unprepared and ignorant condition.

The South accepted it in good faith as the verdict of adverse fate, and as the unavoidable result of the moral sentiment that swept away the institution of slavery, and with the determination to give it an honest support.

The spectacle is presented of two distinct races dwelling together in the same country, under the same government, in the full participation of the same political rights. While grave economic difficulties attended the solution of this problem, and grave political dangers still embarrass its realization, the question deserves to be treated with wisdom and forbearance, and it is hoped that both races will triumph over the difficulties and dangers that environ its full attainment. That the two races may permanently dwell together in peace and amity, under the protection of the same constitutional laws, is a consummation devoutly to be wished, to which the earnest support of the American people should be given.

FACTS REVEALED BY THE CENSUS OF 1880.

We must not, however, give ourselves up to a contemplation of what has been accomplished, but turn rather with renewed interest and zeal to the actual conditions affecting the further progress of education in the South. The Federal census of 1880 entered into the analysis and discussion of social conditions to an unprecedented degree. The comparative study of institutions North and South must be made in the light of the facts there disclosed, until another census shall have given us further information. Investigations of the data of the census bearing upon educational problems were begun by my predecessor, and have been continued under my direction. The results of this work have appeared from time to time in various publications of this Office, notably in Circular of Information No. 3, 1884, published by General

Eaton, and in certain special tables in my Reports for 1885-86 and 1886-87. These studies are continued in the following tables and context. The first six tables relate, as will be seen, to the social conditions directly affecting the force and growth of the school system; the remaining five relate to industrial conditions whose effects, though less obvious, are not less positive.

In the series of Reports published under my supervision, I have employed a fivefold division of the Union. A modification of this division seems desirable for the consideration before us.

This modification is shown in the annexed Map, No. 1, of the eastern and central parts of the country. By "the North" I mean all the States north of the line BD; and by "the South," all the States lying south of that line; the line AC indicates the division of "the East" from "the Centre"; all States and Territories west of Minnesota, Nebraska, Kansas, and Texas are omitted from the present discussion.

Thus, "the East" represents the "ante-Revolutionary" part of the country; "the North" shows the part which was opposed to slavery before the late civil war; "the South" includes those States in which slavery existed as a recognized factor in social, political, and industrial conditions.

MAP No. 1.—A Fourfold Division of the Eastern Part of the Union.

AB: North-Eastern. BC: South-Eastern. CD: South Central. DA: North Central.

ADULTS AND MINORS IN 1880, NORTH AND SOUTH.

The two tables first presented show the number of adults and of minors in eighteen "Northern" and sixteen "Southern" States in 1880, the proportion of adults and minors in one thousand of the population, and the number of minors to one thousand adults.

a Computed in the Bureau of Education.

From these tables Map No. 2 is constructed. It shows for 1880 the number of persons under twenty-one years of age to each thousand of persons twenty-one or more years old.

MAP No. 2.—Number of Minors to 1,000 Adults, 1880.

The duty of sheltering, feeding, clothing, and teaching the young of a community devolves, both by nature and by law, on the mature members. Other things being equal, this duty will be more or less difficult in proportion to the relative numbers of adults and minors.

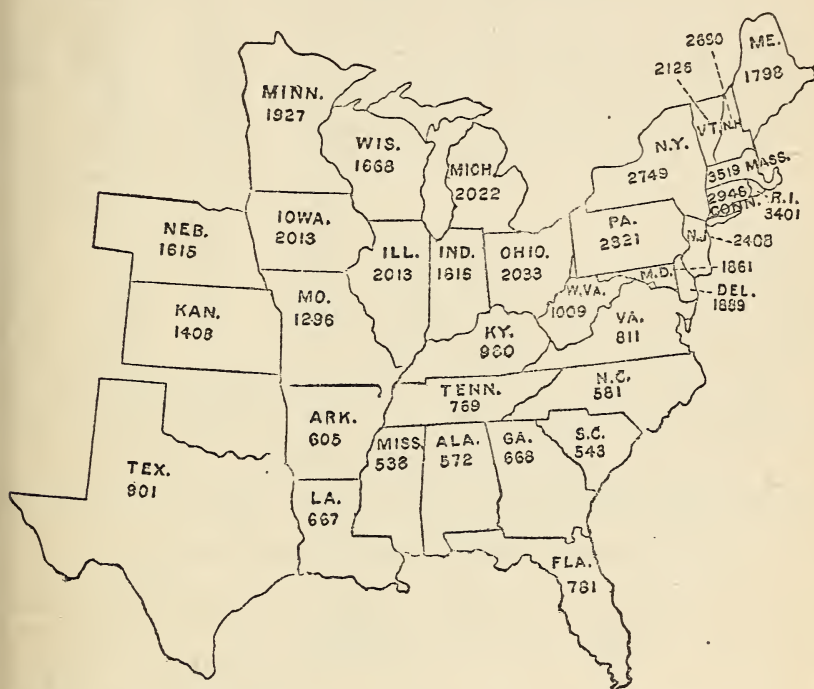

When we use the tables with Map No. 2, we arrive at some striking views. Compare Vermont and Mississippi: Vermont had 578 adults to 422 minors, or 1,000 to 730; Mississippi had 421 adults to 579 minors, or 1,000 to 1,375. Hence the burden on the adults of Vermont was little more than half as heavy as that on the adults of Mississippi.

Here, then, is the first problem in Southern education—how to overcome the difficulties arising from a very large proportion of minor population.

WEALTH AND MINOR POPULATION IN 1880, NORTH AND SOUTH.

I next present two tables, giving, for North and South, the aggregate of State, county, and local debts of each State in round millions of dollars; the true valuation of all real and personal property in each State, also in round millions; the difference between debt and valuation, or the "net" value of property in each State, also in round mill-

ions; and, lastly, the amount of "net" property, in dollars, per capita of the minor population of each State. This per capita amount is, in other words, the net fund that is capable of being taxed for the support and education of each minor citizen. The larger this amount per capita the lower will be the rate of taxation necessary to produce any specified amount of money, or the more money will be collected upon the same rate of taxation.

MAP NO. 3.—Amount of Property per capita of Minor Population in dollars.

Map No. 3 shows at a glance how much more favorably situated the North is in this respect; two of the Northern States had more than three thousand dollars per capita of minors; ten others had more than two thousand dollars per capita of minors; and the other six had more than one thousand dollars per capita of minors. Only four of the Southern States had more than one thousand dollars per capita of minors, the other twelve ranging from \$538 to \$980. Massachusetts had six and one-half times as much as Mississippi per capita of minors.

This is the second problem in Southern education—how to overcome the difficulties arising from the lack of taxable property.

DENSITY OF SCHOOL POPULATION IN 1880, NORTH AND SOUTH.

The next two tables compare the area of the States, north and south, with the number of children of elementary school age.

Observe the comparatively large numbers of such children to the square mile in the States to the north of the Potomac and the Ohio, as shown in Map No. 4.

It is obvious that where the land is thickly settled, schools can be maintained at short distances apart; graded schools can be conducted more readily; pupils can attend more promptly and more regularly; and the teaching force can be more easily maintained.

Map No. 4 shows that forty children can be gathered into school from one square mile in Rhode Island; the same number is scattered over twenty square miles in Minnesota, and over forty square miles in Florida,

MAP NO. 4.—Number of Elementary School Population to the Square Mile in 1880.

Here is the third problem in Southern education—how to overcome the difficulties arising from a thinly settled country.

The Area of the Several "Northern" States, their Elementary School Population in 1880, and the Number of said Population per Square Mile.

States.	Area in Square Miles.	Population from 6 to 13 full Years of Age.	
		Number.	Per Square Mile.
Maine	29,893	<i>a</i> 103,956	<i>a</i> 3.48

a Computed in the Bureau of Education.

The foregoing tables place clearly before us the hindrances to rapid progress toward satisfactory attainment in public instruction in the South. The first, namely, "the excess of minors above adults," is peculiar to that section. The others are encountered in greater or less degree in other sections. The spirit in which they will be met may be judged by the temper and habits of the people.

One great part of the population in the South is of African descent, and inherits much of the improvident temper and desultory habits engendered by tropical life. The white population of the South is, on the other hand, singularly homogeneous in its origin, its beliefs, and its habits. It is in great measure British and Irish by descent, and has preserved much of the tenacity, pugnacity, and rigorous temper of its progenitors. Misfortunes sober and disasters do not appal such a people. The terrible losses of life and treasure during the war of 1861-65 made the impoverished remnant of white population in the South more industrious and more determined than ever before.

CONDITION OF INDUSTRY IN THE SOUTH.

The condition of industry in the South, as compared with the same in the North, deserves attention in this connection.

It is significantly set forth in the four tables that follow, derived from the census of 1880, showing the number of persons, male and female, pursuing gainful occupations in the North and South respectively at that time.

Number of Males 10 or More Years Old in the North, in 1880, Employed and not Employed in Gainful Occupations.

States.	Employed in—					Not Employed in Gainful Occupations. ^a
	Agriculture.	Professional and Personal Services.	Trade and Transportation.	Manufacturing, Mechanical, and Mining Industries.	All Gainful Occupations.

Reducing the numbers of the "totals" in these four tables to parts in 1,000, it is manifest that the proportion of people, both male and female, at work in the South was greater than the same class in the North.

In 1,000 males, 10 or more years of age:

	There Were Employed in—					There Were Not so Employed. ^a
	Agriculture.	Professional and Personal Services.	Trade and Transportation.	Manufacturing, Mechanical, and Mining Industries.	All Gainful Occupations.	
The "North"	296	150	111	214	771	229
The "South"	545	120	63	82	810	190

In 1,000 females, 10 or more years of age:

	There Were Employed in—					There Were Not so Employed. ^a
	Agriculture.	Professional and Personal Services.	Trade and Transportation.	Manufacturing, Mechanical, and Mining Industries.	All Gainful Occupations.	
The "North"	1	77	4	49	131	869
The "South"	90	73	4	11	178	822

^a Computed in the Bureau of Education.

It is not implied that labor in the South is as regular, as judiciously applied, or as effective as labor in the North; doubtless in many cases it is more unmethodical, and still oftener less profitable; but it is there and at work, in spite of all disadvantages of climate and all previous conditions of life. The smaller wealth and scantier leisure of the South are shown particularly in the greater proportion of females employed, and still more specially in the very large number engaged in agricultural pursuits. This applies more particularly to the colored population, which is almost entirely engaged in that branch of industry. As fast as education renders the masses in the South more apt in the performance of diversified labor, and as soon as manufacturing and mechanical industries suitable to their strength are developed and brought near their homes, we shall see a gradual transference of Southern laborers from the farm and field to other kinds of toil. But this is yet distant; and the South must always, in the future as in the past, be mainly an agricultural country.

These remarks do only partial justice to the situation in 1880; but perhaps what has been said is enough to show that the burden of public education in the South is a real and heavy one. I believe that the history of the past decade will show that, though heavy, it has been cheerfully borne, and will exhibit more favorable conditions.

The facts and relations shown by the figures given above demand certainly the serious attention of all persons interested in the public welfare, and most especially of all charged with the conduct of public affairs. If popular education be indeed the safeguard, and popular liberty the bulwark of a free government, it is a matter of grave concern if one section of the country be found struggling against disparities in the effort to secure this protection and defense. The inequalities which have been pointed out are so interwoven with all the social and business interests of the different sections that it is impossible to indicate either the extent to which equality of educational provision is possible, or the means by which it may be accomplished.

Judged by the experience of other communities the industrial condition of the South as disclosed by the census, is the most hopeful augury for the free school system. In the North industry, thrift, and liberty have found their natural outcome in a general demand for knowledge, and in determined efforts for the supply of that demand. Is it not reasonable to look for the same results in the South? Indeed her attitude with respect to that issue need no longer be simply that of hope or expectancy.

SOURCES OF SCHOOL REVENUE.

The firm hold which the free school has taken in Southern communities, as a matter for local action, is an important fact in the detailed record of the year. For proof of this statement I need only refer to a single page of that record. Table 13, Chapter III, shows the relative importance of the various sources of school revenue. From this it appears that there are twenty-four States and five Territories in which the

local tax exceeds all other sources of revenue. . Nine of these States are included in the group which I have classed as the South, as against thirteen belonging to the group which I have called the North.

But the experience of the States to which we instinctively turn for guidance in the progressive conduct of the school system, discloses also the importance of another principle of action. From the nature of things, local effort can not be uniform, nor in all cases sufficient. Hence communities are found combining their efforts to secure equal diffusion of educational privileges. This principle of combined action is illustrated in the levy of a general tax, by means of which the whole people contribute to the support of public education in the entire State. By reference to Table 13 it will be seen that, with two exceptions, the States here classed as the North levy such a tax, and that in three States of the group it yields the larger portion of the school revenues. It is a more important source of revenue in the States classed as the South. In seven of these the State tax yields more than half the support of the schools, while in three only does it afford less than one-fourth of the revenue.

It is easy to demonstrate the absolute necessity of both local and State taxation, and to show further that under certain conditions national aid may properly be invoked for the educational necessities of particular regions. This may be done either by a specific appropriation or by the appropriation of the proceeds of the sales of the public lands, and in either case the effect would be the same.

The adjustment of the two principles of public action here pointed out, their due development, and their judicious application, are among the great problems which are forced upon our thoughtful attention at the present time.

THE RECORD OF THE YEAR.

The educational record of the year is presented and discussed in the succeeding chapters of this Report. It is an interesting and suggestive, and in many respects a remarkable record. Its importance is indicated by the large amount of money and property involved in the operations of the various scholastic agencies, and by the statistics showing the number of children and youth brought under their influences. The expenditure for public education amounted to \$122,455,000 in round numbers, and more than twelve million children were enrolled in the schools, of whom eight millions were in average attendance.

The progress of this system is marked not only by the increase in material resources, teaching force, and average attendance, but also by improvements in the spirit and methods of the work.

MANUAL TRAINING.

Among the most important of these improvements is the introduction of manual training in many cities and towns. The conflict of opinion developed in the discussion of this subject arises in a measure from the widely different experiments to which the term is applied. Thoughtful

men deprecate all movements which threaten to transform the common schools, or any grade of the common schools, into instruments for industrial training in the sense of trade teaching. On the other hand, all, even the most conservative, admit that the education of the children should involve the exercise of the mind, the eye, and the hand. Upon their systematic training depends the complete development of the individual, as well as his complete preparation for industrial life. The adoption of constructive exercises as a part and parcel of our common school methods, is a movement along lines laid down by Rabelais, Comenius, Pestalozzi, and other great philosophers. It is a movement which accords with sound principles; it tends toward methods of instruction applicable to many branches of study, and yielding larger results with less friction and less waste of time than is possible in the use of purely mental exercises; but the movement should be so guarded as not to confuse or obscure the distinctions between general and particular ends in education. The great purpose of popular education is the elevation of the people, which depends upon intellectual activity and spiritual insight, rather than upon skill. As expressed by Dr. W. T. Harris in a discriminating discussion on the "Psychology of Manual Training":

Man elevates himself above the brute creation by his ability to withdraw his attention from the external world of the senses and give attention to energies, forces, producing causes, and principles. He can, in short, look from the particular to the general. He sees the particular object by his sense-perception, and reflects upon its casual processes by his intellect. Insight into the cause enables him to anticipate perception and to reinforce it. Thus without losing the particular he grasps together the whole realm of the particular in the general, * * * in mastering the cause of anything he grasps together and comprehends an indefinite series of effects. The senses perceive the particular thing or object, but the reason perceives the casual energy by reflection and introspection.

These different effects are perfectly clear to educators who, as regards manual training, differ chiefly in their opinions as to its educational value. It will not be easy to determine whether these differences of opinion are radical or not, until precise meaning is given to the expression. A notable endeavor to fix the meaning of the term "manual training" has been made in a report by Nicholas Murray Butler, chairman of the Committee on Manual Training of the New Jersey Council of Education, one of the leading advocates of the system. In this report he said:

Manual training * * * is instruction in thought-expression by means other than verbal language and gesture. It includes necessarily instruction in delineation and instruction in constructive work; whether or not the tools commonly used for working wood and iron shall be employed for the purpose of giving a part of this instruction in constructive work is a mere incident. We are of opinion that the educational value of proper instruction in the use of tools has been fully proven; but it is not to be supposed that the means of giving instruction in manual training will not improve and develop, as text-books, maps, and other school-room apparatus have improved and developed.

Mr. Butler then goes on to declare that manual training is only an ex-

tension of kindergarten principles to higher grades; and that it involves the "application of a great pedagogic principle," and is not "an attempt to improve the methods of high school instruction alone." To give practical expression to these views, the following resolution was submitted by him to the Council and passed without a dissenting vote:

Whereas, There are several and conflicting uses of the term *Manual Training*, be it hereby

Resolved, That the New Jersey Council of Education defines *Manual Training* as training in thought-expression by other means than gesture and verbal language, in such a carefully graded course of study as shall also provide adequate training for the judgment and the executive faculty. This training will necessarily include drawing and constructive work, but experience alone can determine by what special means this instruction may best be given.

Using the expression "manual training" in the sense here given, the argument for its introduction into the public school course is placed on exactly the same basis as the argument for other essential branches of education.

THE HISTORY OF AMERICAN EDUCATION.

While carrying forward the work of my predecessors in the conduct of the Bureau of Education, promoting the interest of common schools, etc., I have endeavored to advance the educational interests of the country by a systematic inquiry into the history of colleges and universities in the various States of the American Union. Beginning with the history of old William and Mary College, the Harvard of Virginia and the South, I have caused investigation to be extended throughout all the United States, embracing every individual State, by competent scholars, working under the editorial supervision of Dr. Herbert B. Adams, of Johns Hopkins University. While as yet we have only the first fruits of these educational studies in fields hitherto unbroken, nevertheless the returns have been so gratifying and so highly appreciated, both by practical educators and by the public at large, that I have continued this line of publication by the Bureau as rapidly as the State monographs have been completed.

The influence of the monograph upon William and Mary College in securing the revival of that ancient and honored institution, I have already indicated in a former Report, 1886-87, page 27, where is given a letter from General William B. Talliaferro, president of the board of governors, containing these words: "The restoration of the oldest but one of the institutions of learning in the country will be quite largely due to the valuable paper which you have published."

History of Education in Virginia.

At my request, the work of inquiry into the educational history of Virginia, so profitably begun, was continued to the University of Virginia and throughout the State. The editor devoted his special attention to Jefferson's original and unique academic foundation, the first representative of the modern university spirit in the South, if not in the country at large. The various colleges of Virginia were described in

authorized sketches by representatives of the institutions concerned. The whole work is a combination of individual and coöperative methods of treatment. The peculiar interest and importance of Jefferson's educational labors in Virginia, including his pleas for common schools and local self-government, are described more particularly in the following letter, transmitting the monograph from this Bureau to your Office:

DEPARTMENT OF THE INTERIOR,

BUREAU OF EDUCATION,

Washington, D. C., December 9, 1887.

THE HONORABLE THE SECRETARY OF THE INTERIOR,

Washington, D. C.

SIR: The interest awakened by the History of the College of William and Mary, prepared by Dr. Herbert B. Adams, of Baltimore, and published by this Bureau as Circular of Information No. 1, 1887; and the Study of History in American Colleges and Universities, also prepared by Dr. Adams, and published as Circular of Information No. 2, 1887, justifies a further inquiry into the history of higher education in the State of Virginia, and in other States of the American Union. The work should be done gradually and methodically. Without attempting to cover the entire field at once, I have thought it wise to encourage the preparation by Dr. Adams of a special monograph concerning Thomas Jefferson and the University of Virginia, with brief historical sketches of the various colleges in that State. Jefferson's work was of fundamental importance in the establishment of the University of Virginia, which is the historical successor of the College of William and Mary. The connection of the two institutions has been clearly traced by Dr. Adams in Jefferson's projects for educational reform. The first idea of the University of Virginia was the proposed transformation of the old colonial college into something higher and broader. But this idea failed of realization by reason of sectarian opposition to an Episcopal establishment. The present University of Virginia is an interesting illustration of the possible union of religious interests in the support of higher education by the State.

Jefferson was the first conspicuous advocate in this country of centralization in university education, and of decentralization in preparatory and common schools. He was a thorough believer in the concentration of State aid upon higher educational interests, and in the support of primary and secondary education by local taxation and private philanthropy. In his judgment, local government and common schools should have been established together and concurrently in the State of Virginia. He would have subdivided the counties into "hundreds" or "wards," corresponding to the militia districts, and have made the district school-house the place of local assembly and primary education. The training of every community to good citizenship and self-help by active participation in local affairs, such as the support of schools, roads, and bridges, was the ideal of popular education in the mind of Jefferson. He proposed that the children should be taught not merely reading, writing, arithmetic, and geography, but also through reading-books the history of the world and of their own country. Such an educational ideal, at once sound, sensible, and thoroughly democratic, is worthy of reconsideration after the lapse of more than a century since it was first proclaimed.

Jefferson devised an ingenious plan whereby the boys of best talent, the sons of the people, might be discovered and sent forward, although poor, to preparatory colleges, and finally to the University of Virginia. Such a plan is now in practical operation in the State of New York, in connection with Cornell University, which accepted the agricultural college land grant upon the condition of free education to talented graduates of local high schools and academies, and also prevails in many other States, where young men receive the benefits of the higher education, without charge for tuition, at the State universities and agricultural land-grant colleges. Natural selection and the survival of the fittest are great needs in American schools, colleges, and

universities. Jefferson's ideas, if they should ever be realized throughout the country, will deliver us on the one hand from the over-education of mediocrity, and on the other from the under-education of genius. It is the duty of democracy to evolve from itself the highest talent, not only for government and administration, but for the advancement of science and the arts.

The idea is far too prevalent that the American people have done their whole duty in everywhere instituting common schools by State authority. Popular education in this form is indeed a recognized necessity, and, generally speaking, it is an accomplished fact; but there is a higher form of popular education, to the necessity of which the people as a whole have not yet risen. That form is university education in the interest of good government and the promotion of science in the United States.

Washington had this higher form of education in mind when he said to Congress that "a flourishing state of the arts and sciences contributes to national prosperity and reputation," and when he advocated a national institution in which the primary object should be "the education of our youth in the science of government."

Jefferson had it in mind when he was urging the State Legislature to establish the University of Virginia, and when he thus defined the objects of the higher education:

"To form the statesmen, legislators, and judges, on whom public prosperity and individual happiness are so much to depend; to expound the principles of government, the laws which regulate the intercourse of nations, those formed municipally for our own government, and a sound spirit of legislation, which, banishing all arbitrary and unnecessary restraint on individual action, shall leave us free to do whatever does not violate the equal rights of another; to harmonize and promote the interests of agriculture, manufactures, and commerce, and by well-informed views of political economy to give a free scope to the public industry; to develop the reasoning faculties of our youth, enlarge their minds, cultivate their morals, and instil into them the precepts of virtue and order; to enlighten them with mathematical and physical sciences, which advance the arts and administer to the health, the subsistence, and the comforts of human life; and, finally, to form them to habits of reflection and correct action, rendering them examples of virtue to others and of happiness within themselves. These are the objects of that higher grade of education, the benefits and blessings of which the Legislature now propose to provide for the good and ornament of their country, the gratification and happiness of their fellow-citizens."

Jefferson's views upon the relation of the State to university education are so striking and so timely in these days, when some Legislatures are treating State universities in a grudging, short-sighted, and parsimonious spirit, that I can not refrain from quoting still further from that remarkable report which decided the establishment of the University of Virginia:

"Some good men, and even of respectable information, consider the learned sciences as useless acquirements; some think they do not better the condition of men; and others that education, like private and individual concerns, should be left to private, individual effort; not reflecting that an establishment embracing all the sciences which may be useful and even necessary in the various vocations of life, with the buildings and apparatus belonging to each, is far beyond the reach of individual means, and must either derive existence from public patronage, or not at all. This would leave us, then, without those callings which depend on education or send us to other countries to seek the instruction they require. * * * Nor must we omit to mention * * * the incalculable advantage of training up able counsellors to administer the affairs of our country in all its departments, legislative, executive, and judicial, and to bear their proper share in the councils of our National Government; nothing more than education advancing the prosperity, the power, and the happiness of a nation."

While the present monograph describes, for the encouragement of the friends of higher education, the triumph of what was called in Virginia the "holy cause of the University," after nearly fifty years of arduous struggle by Jefferson with popular indifference and local jealousy and ill-advised opposition, the study is not without its

interest for the friends of primary education, which Jefferson had quite as much at heart as university education.

He believed in aiming at the highest, as did the founders of Harvard and William and Mary Colleges. He believed that with the opening of mountain sources of learning, the lower valleys and broadening plains of popular education would the better flourish. In studying the historical origin of the University of Virginia, we discover its connection with enlarged and wide-reaching ideas of a system of public education, the influence of which should extend far beyond the borders of a single State.

In the extensive correspondence, legislative inquiries, reports of educational commissions, and legislative enactments which led to the foundation of the University of Virginia in 1819, we have a rich fund of suggestive ideas for the founders of educational institutions, whether public or private, high or low. The range of thought is from a district school to a national university. These ideas are all the more interesting, because the best of them are clearly the product of Jefferson's thoroughly democratic mind, enriched by higher education, by travel, and by an intelligent study of the best institutions of learning in the New and in the Old World. It is surprising to observe how Jefferson anticipated many of the modern educational ideas which have come into conspicuous favor since his day. For instance, non-sectarianism in university education; ethics and the languages of the Old and New Testaments as a suitable university basis for theological training; the importance of the academic study of history, politics, and economics; the teaching of history in common schools by means of reading-books; the practical value of the modern languages; the significance of German studies, particularly of Anglo-Saxon; the early English origin of free institutions; the advantage of student self-government as a substitute for faculty-espionage; physical education; military training of students; manual and industrial training; the connection of higher education with the higher interests of the American people. Jefferson seemed to recognize that our schools, colleges, and universities, if they are to serve efficiently the state or country in which they are placed, must have broad foundations, and cultivate, instead of selfish exclusiveness, a noble popularity which does honor to the Republic.

To the University of Virginia, Jefferson's creation, the whole country is indebted for the following distinguished services to the higher education: (1) The recognition of real university standards of instruction and scholarship. (2) The absolute repression of the class-system and the substitution of merit for seniority in the award of degrees. (3) The first complete introduction of the elective system. (4) The establishment of distinct "schools," in which great subjects were grouped; for example, ancient languages, modern languages, mathematics, law and politics; each school having its autonomy and its own standard of graduation. (5) The institution of constitutional government, in academic form, with an appointed president or chairman of the faculty, holding office for one year, but eligible for reappointment by the board of visitors. (6) The promotion of self-government among the students, with the cultivation of an *esprit de corps* sustaining high standards of academic honor and scholarship.

I beg leave to recommend the publication of this monograph, which illustrates the educational views and wide influence of the Father of the University of Virginia, who was also one of the founders of this Republic.

The monograph contains, besides Dr. Adams's original researches, an interesting and valuable study by one of his graduate students at the Johns Hopkins University, Mr. William P. Trent, of Richmond, who earned his degree of Master of Arts at the University of Virginia, and who, at Dr. Adams's suggestion, has investigated the influence of Jefferson's institution upon the life and thought of the South. Mr. Trent has also prepared, with very great labor, statistical tables showing the various lines of public and professional activity taken by the alumni of the University, now widely scattered throughout the Southern States.

Following these tables is an authorized sketch of the present condition and organization of the University, by Prof. John B. Minor. A bibliography of the best sources

of information is appended by the editor. Authorized sketches of Hampden-Sidney, Randolph-Macon, Emory and Henry, Roanoke, and Richmond Colleges, and of Washington and Lee University, have been secured through local coöperation. Illustrations for the work have been obtained from a variety of sources. The most interesting are copies of Jefferson's original drawings for the construction of the University buildings.

This contribution to the educational history of Virginia is the first of a State series, which, with your approval, Dr. Adams will continue to edit for the Bureau of Education. The present monograph will be followed by historical studies of education in North Carolina, South Carolina, and Georgia, by student representatives of those States.

The Bureau of Education has now in course of preparation a second coöperative series, on the history of higher education in Ohio, Indiana, Illinois, Michigan, and Wisconsin, to mark educationally the centenary of the first settlement of the old North-West Territory. This plan of work has been undertaken with your sanction and will be continued during the coming winter.

I deem it not improper, in the conclusion of this letter, to express how deeply the Bureau of Education is indebted to your generous and liberal encouragement, in its efforts to aid and broaden the scope and usefulness of its work.

In being elevated to that august tribunal which presides over one of the three departments of this great Union of States, you will carry with you the best wishes of the friends of education, and will view from a higher stand-point the value and beneficence of public education to the whole country.

I have the honor to be, very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

As an index of the favorable reception and high estimation of this monograph on "Thomas Jefferson and the University of Virginia," I have requested the privilege of publishing the following grateful resolutions by the Faculty of that institution, transmitted by the chairman, Prof. William M. Thornton, to the editor of the Contributions to American Educational History:

CHAIRMAN'S OFFICE,
UNIVERSITY OF VIRGINIA, VA.,
January 2, 1889.

DEAR SIR: In enclosing a copy of resolutions passed by our Faculty at the last meeting, I venture to avail myself of the opportunity to express my own sense of obligation for your very handsome contribution to our history. Like every one else interested in this University, I have read your monograph with the greatest pleasure. Even those who are best informed as to our origins find new light shed upon them by your researches. And the work will long remain the authentic record of our foundation.

* * * * *
Very respectfully,

WM. M. THORNTON,
Chairman of Faculty.

RESOLUTIONS.

The Faculty of the University desire to place on record their sense of the value of the work performed by Prof. Herbert B. Adams, of Johns Hopkins University, in his monograph entitled "Thomas Jefferson and the University of Virginia," lately printed under the direction of the United States Bureau of Education.

Contributing, as it does, to illustrate the self-denying patriotism, the broad and enlightened views, and the profound sagacity of our illustrious founder, we cannot but regard it with a high degree of favor.

It has set before the American world in lively colors and in a most attractive manner Mr. Jefferson's tireless industry and painstaking in bringing about the establishment of the University, so as to enhance the renown even of that great statesman; and to justify the sentiment which he desired should be inscribed on his tomb that, as part of his threefold claim to the special gratitude of his countrymen, he was the Father of the University of Virginia; and it has successfully elucidated the peculiar features of the University to which Mr. Jefferson ascribed paramount importance, and has thereby rendered an essential service to the cause of liberal University education in this country.

It is therefore resolved, (1) That the thanks of the Faculty in behalf of the University, and of themselves, be tendered to Professor Adams for the tribute which he has thus paid to the "Father of the University," and to the University itself; and for the encouragement and aid which his work affords to the laborers in the sphere of the higher education of youth.

(2) That the Chairman of the Faculty be requested to cause a copy of these minutes to be transmitted to Mr. Adams.

History of Education in North Carolina.

A monograph upon the "History of Education in North Carolina" has been prepared by a native of that State, Dr. Charles Lee Smith, sometime Fellow in History at the Johns Hopkins University. Himself a graduate of a North Carolina college and well acquainted with college and university men in that State, he travelled over nearly the entire region, making a personal visitation of the leading institutions of both races. He also paid particular attention to the origin of common school education in North Carolina. Dr. Smith had the coöperation of teachers, professors, and college presidents wherever he went, and accumulated a rich fund of material information, both from personal inquiries and from original investigation of college archives. He enjoyed also the first practical use of the proof-sheets of the newly published historical records of North Carolina.

The following letter, officially addressed to you by me, will best serve to characterize this interesting and important contribution to the educational history of the Old and New South :

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., December 9, 1887.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C.

SIR: In pursuance of the plan already approved by you for a systematic inquiry by the Bureau of Education into the educational history of the United States, I beg to recommend for publication the second of the series of State monographs in this direction edited by Dr. Herbert B. Adams, whose studies upon the College of William and Mary, and Thomas Jefferson and the University of Virginia, with the monograph upon the Study of History in American Colleges and Universities, formed the introduction to this new line of inquiry.

The subject of the present monograph is the history of education in North Carolina. It is an original and valuable contribution, and deserves to be widely read. In this monograph Mr. Charles Lee Smith, who has been trained in historical methods at the Johns Hopkins University and now holds a fellowship in history and poli-

tics at that institution, gives the results of a thorough and careful study of the educational history of his native State.

For North Carolina this is pioneer work. The history of education in that State has hitherto remained unwritten. That the old North State has failed to receive just recognition at the hands of some historians, is due in great measure to the fact that many important phases of her early history have remained undeveloped by her own sons, to whom they were known, and who have allowed the prejudiced statements of early chroniclers, ignorant of the facts, to be accepted without contradiction as authoritative.

The writer has traced the genesis and development of education in North Carolina from the first settlement of that State to the present time. For this purpose he is the first to exploit the colonial records, the publication of which was begun last year, and the early laws of the State. He has also utilized early newspaper files, and all the published biographical and historical works relating to his State to be found in the public libraries of Raleigh, Washington, and Baltimore, besides certain private collections and personal correspondence.

In the study of education as a growth North Carolina affords peculiar advantages. The character of the early settlers, the objects of their coming, and the results achieved by them in their struggle against oppressive government give the history of that State unusual interest. Bancroft says, "North Carolina was settled by the freest of the free," and the records of the colony show that a constant warfare was waged against oppression until freedom was won. This fact was emphasized and is illustrated in the proceedings of that meeting of patriots at Mecklenburg, in 1775, which, without doubt, is one of the most memorable events of our Revolutionary period. This struggle was for civil and religious liberty, and Mr. Smith demonstrates how intimate was the connection between the liberties and the educational history of the people. The government is, perhaps, to be censured that schools were not earlier provided. It is an error, however, to suppose, as has been stated by some writers, that there were no good schools in the State previous to the Revolution; for it is shown that there were many creditable institutions, several having a wide reputation.

The higher education has been principally treated in this sketch, although the history of primary and secondary instruction has not been neglected. The influence of certain classes of immigration and of institutions outside the State, especially of Princeton, which previous to the establishment of the University of North Carolina was largely patronized by the young men of that State, is clearly shown. Many interesting facts concerning noted educators of the State are brought out. The sketch which is given of the University of North Carolina is the first full account of that institution which has ever been written. The writer thinks no institution of this country has a more honorable record, and it is claimed that in proportion to the number of its alumni it stands second to none in the number of the distinguished public men it has given to the State and Nation.

The account which is given of its "influence upon the South" makes an admirable showing. As indicative of its wide-spread influence upon the country, a President, a Vice-President, many Cabinet officers, ministers to foreign countries, Senators, Governors, and other distinguished men are mentioned among its alumni.

President Andrew D. White said of this institution: "I remember in my young manhood the University of North Carolina was always spoken of with the greatest respect among men who knew anything about an American collegiate education. While the Universities of Virginia and Johns Hopkins have to some extent drawn attention away from it, I see no reason why its present Faculty should not give it a commanding position in the South-East of our Republic."

The subjects taught in the institutions for the secondary and the higher education are noted from time to time, thus showing the general educational development. The present status of education in North Carolina is well pictured. The work, while

strictly historical, is both practical and suggestive. Hon. Henry Barnard, the first Commissioner of Education, once said that "no subject now interesting or important can be adequately understood or further investigated unless proper pains be first bestowed upon its history. * * * There is no department of human exertion, however, in which this preliminary historical knowledge is so necessary as in education. For this there is both a general and a special reason. The education of a people bears a constant and most pre-eminently influential relation to its attainments and excellencies—physical, mental, and moral. The national education is at once a cause and an effect of the national character; and, accordingly, the history of education affords the only ready and perfect key to the history of the human race and of each nation in it—an unfailing standard for estimating its advance or retreat upon the line of human progress.

"But the special reason just alluded to is yet more in point at this time. It is, that there is no department of human exertion whose annals are more brilliant with displays of industry, talent, and genius, whether successful or unsuccessful, and consequently none in which a reference to the past will afford such abundant materials for improvement in the present."

Urging, therefore, the publication of this monograph and the encouragement of this new line of educational inquiry to be continued by the Bureau of Education, not only in the South but in the North-West and South-West and beyond the Mississippi, where such inquiries are most needed,

I have the honor to be, very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

As an evidence of the cordial approval with which this monograph has been received, the following resolution, among many other favorable acknowledgements of this work which have been transmitted to me, is here published:

The Faculty of the University of North Carolina desire to express to Hon. N. H. R. Dawson, Commissioner of Education of the United States, their gratification and appreciation of the intelligent generosity and public spirit of the Bureau of Education in publishing, illustrating, and distributing the *History of Education in North Carolina* and other circulars of information, which they believe will greatly aid the cause of education in the South and throughout the country, and will prove a valuable contribution to the permanent history of education.

History of Education in South Carolina.

A fourth monograph in this new series concerns "The History of Higher Education in South Carolina," by O. Meriwether, of that State. Like Dr. Smith, trained in the historical methods of work as pursued at the Johns Hopkins University, Mr. Meriwether was favored with much original manuscript material supplied by friends and correspondents in South Carolina, and he spent one long summer vacation in the library of the Bureau of Education at Washington, digesting the materials there found for the educational history of his native State. South Carolina is hardly less memorable than old Virginia for its early attention to higher collegiate education. From the scattered condition of its population, free schools were not so numerous in South Carolina as in States more compactly settled; nevertheless, much more was accomplished in this direction than is ordinarily supposed. Some of the clas-

sical academies of South Carolina were of a very high order, notably Dr. Waddell's school, which gave John C. Calhoun his preparation for the Junior class in Yale College. South Carolina College deservedly occupies an honored place in the educational history of the South. It was there, at Columbia, that some of the best Southern men, *e. g.*, William C. Preston, George McDuffie, Hugh S. Legaré, and James Louis Petigru, were trained for public and professional life. Here, too, flourished some of the ablest professors of their time. Here labored for many years the once famous Dr. Thomas Cooper, who was Jefferson's first choice for the University of Virginia. Here taught that distinguished German-American, Dr. Francis Lieber, the pupil and friend of Niebuhr, and the first great transmitter of German historical and political science to a new world. Here Lieber wrote those remarkable works on Civil Liberty and Political Ethics upon which his fame as a scholar rests unshaken. The distinguished theologian and Presbyterian divine, Dr. James H. Thornwell, was also connected with the institution for a number of years as professor and president; as was also that great and distinguished prelate, Stephen Elliott, the first Protestant Episcopal bishop of Georgia. He declined the presidency, but was a member of the Faculty. Into the details of the research, which occupied Mr. Meriwether for many months, I can not enter in this connection. The following official letter will furnish perhaps a convenient résumé. The active exertions of the various denominations establishing schools are sketched at some length:

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., June 12, 1893.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C.

SIR: The accompanying monograph, prepared by Mr. C. Meriwether, A. B., Johns Hopkins University, is designed to trace the history of higher education in South Carolina, his native State, and to give a sketch of the development of the free, or public school system. The earliest educational efforts are described, and instances are given illustrating the interest of South Carolina, when yet a colony, in providing the means for the intellectual improvement of her sons. Far from being backward in education, the colony was especially alive to the necessity of mental development. Not only were schools founded and maintained in the province by the government and through private and charitable aid, but many youths were sent to England for their education. The influence of such men on their return was so great and lasting that, even to the middle of the present century, schools in Charleston, modelled on the English plan, were very popular.

The birth of colleges was late and their growth slow; there was, therefore, chance for a good system of academies to develop. These were planted in all parts of the State, so that a good training school was within the reach of all. The number continued to increase until the outbreak of the War. Sufficient time has not elapsed for the public high schools fully to resume their place. The training given in them was thorough and advanced. It was not unusual with some of them to prepare boys for admission to the Junior class of advanced colleges. The most famous academy was that presided over by Dr. Moses Waddell, the Thomas Arnold of South Carolina. No other man in that State has taught boys who afterwards left their impress so

deeply on the political history of the country. William H. Crawford, John C. Calhoun, and George McDuffie were trained by him.

Although there is mention in the House Journal of 1723, of a proposal to establish a college, and a bill was introduced into the colonial Legislature in 1769 for this purpose, yet no action was taken until the present century. An act was passed in 1785 establishing three colleges in the State, yet only one of them ever gave collegiate instruction. In respect to collegiate education, the comparative advantages and attendance in that section are fully set forth in statistics, gathered chiefly from De Bow's Review, one of the best scientific products of the South. The college attendance in the five upper Southern States was one student to three hundred and eighty-nine white inhabitants.

The College of Charleston, while its foundation can be traced to the legislative act of 1785, has given collegiate instruction only since the first quarter of the present century. It is supported very largely by income from vested funds, the result of endowment by public-spirited citizens in and near Charleston. Over half the three hundred thousand dollars endowment was given by Mr. Baynard during the War, in 1864. The attendance has never been very large, but the training in mathematics and ancient languages has always been thorough. Every denomination of any strength in the State has founded a college. They can not be called strictly sectarian colleges, since no religious tests are required of any of the students. In the main they follow the average college course, but, owing to want of funds, they can not offer very many electives. It is gratifying to state that the funds and attendance of nearly all of them are gradually increasing. All of them, except Wofford College, at Spartanburg, are the result of the small gifts of church members. Wofford College is due to the beneficence of one man, Benjamin Wofford, a Methodist minister. At the time of his bequest, in 1850, it was probably the largest amount ever given by a Southern man for educational purposes. The War was most disastrous to all these institutions in sweeping away their endowments. The various denominations have established female schools of a fair grade.

The first attempt made to establish a general system of free schools was in 1811. The act was passed after bitter opposition on the part of some of the up-country members, and provided free instruction for all children, but gave the preference to poor children. It did not contain a provision for a supervising officer of the whole system, like the present Superintendent of Education. These mistakes were an insuperable bar to success; and although the annual appropriations were doubled in 1852, being made seventy-four thousand dollars, yet the universal testimony was that the schools were a failure. On the adoption of a new State Constitution in 1868, the present public school system was introduced. Its usefulness has been greatly increased by the efficient management since 1876.

The attention paid by the State to the education of the colored citizens is well illustrated in Claflin University, supported largely by the State. It has seventeen teachers and six courses of instruction, and its students at the last session numbered nine hundred and forty-six. It is the largest and one of the best colored schools in the South.

The most important phases of advanced instruction in South Carolina are those connected with the State institutions. The Military Academy at Charleston was designed to furnish trained soldiers for South Carolina. It receives an annual appropriation of twenty thousand dollars for the support of sixty-eight beneficiaries. Its course is modelled after that of West Point.

The College of South Carolina is the best of all the institutions in the State. It was opened for students in 1804, and has ever since exercised a strong influence on the politics of South Carolina, except during the reconstruction period. Every politician of any note in the State, except John C. Calhoun, has been for a time connected with the institution. Thomas Cooper, one of the presidents of the college, supplied the free traders with materials for their attacks upon the tariff. One of the greatest

political philosophers of America, Francis Lieber, did his work and made his reputation during a sojourn of twenty years at Columbia, S. C. These two men were the greatest scholars connected with the institution, and their reputation has carried its name and fame far and wide. Owing to the generosity of the Legislature in appropriating thirty-seven thousand dollars for the support of the college, the corps of instructors has been increased, departments have been added, and the whole outlook is more promising than ever before.

In the preparation of this paper, the library collections of the Bureau of Education in Washington have been extensively used. Special acknowledgments for assistance are due President McBryde and Prof. R. Means Davis, who supplied much manuscript material; to G. E. Manigault, M. D., of the College of Charleston, and Prof. H. T. Cook and President Charles Manly, of Furman University; to John F. Calhoun, a great-nephew of John C. Calhoun, for aid in the history of the Willington Academy, under Moses Waddell; to Hon. William A. Courtenay; to Gen. Edward McCrady, Jr.; to Gen. Geo. D. Johnston; and to many others who kindly gave the author suggestions and information. Valuable facts were also derived from a private memoir of Paul Hamilton, through whose able administration of finances it became possible for the State to found the University.

I respectfully recommend the publication of this monograph, which is one of the series prepared by the Bureau of Education.

Very respectfully yours,

N. H. R. DAWSON,
Commissioner of Education.

History of Education in Georgia.

The fifth monograph in the series of Contributions to American Educational History relates to the "History of Education in Georgia." It was prepared by Mr. Charles Edgeworth Jones, son of Col. C. C. Jones, of Augusta, the historian of Georgia.

The author, after graduating from the State University, spent several years at the Johns Hopkins University in the department of history and politics. After returning to his native State, while studying law and preparing for a professional career, he found leisure for an exhaustive study of the educational development of Georgia.

Mr. Jones's work is by far the most complete statement of the school and college opportunities offered to both races in that State. Like all the preceding monographs Mr. Jones's contains pictorial illustrations of school and college buildings and a great variety of instructive facts and statistics concerning the progress of education from the earliest period. The work will be found of great practical service by the friends of Southern education. The following prefatory letter best explains the exact scope of the monograph:

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., October 10, 1888.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C.

SIR: The present monograph was prepared by Mr. Charles Edgeworth Jones, of Augusta, Ga., a son of the historian of that State, and a graduate of Johns Hopkins University. The work was undertaken by my direction under the supervision of Dr. Herbert B. Adams, editor of the present series of contributions to American Educational History, and was authorized by your predecessor.

Mr. Jones discusses the history of education in the State of Georgia. The inquiry has been carefully prosecuted, and all available sources of information appear to have been intelligently utilized.

The paper opens with a sketch of the educational advantages afforded by the few schools which existed during the colonial epoch. The information and conduct of academies after the Revolutionary War are next considered. Among the more prominent were the academies of Sunbury, and of Richmond County, which exerted a marked influence at that early period, and constituted the most important factors in the education of the sons of the infant Commonwealth.

The author then addresses himself to a review of the elementary education afforded in the rural schools, the teachers of which were supported by the tuition derived from the attending scholars.

Carefully and with an exhaustive analysis of the laws and constitutional provisions bearing upon the subject, are the rise, development, and decadence of the "poor school system" noted.

Prior to the late Civil War steps had been taken to establish a system of common schools accessible to all white children between the ages of six and eighteen. They were, however, interrupted by the War, and it was not until some five or six years after the cessation of hostilities that the present system of public schools was inaugurated. With the opportunities presented by this system for the instruction of the youths of the State, this paper deals fully.

Having discussed these preliminary topics, Mr. Jones turns his attention to the history and present status of higher education in Georgia, as represented in the University of the State and its branches, in various denominational colleges, and in special institutions designed to facilitate studies in law, medicine, theology, science, and art. All charitable and literary institutions ministering to intellectual, social, and moral improvement receive due consideration.

Upon a review of the whole subject, it will be seen that education in Georgia, both elementary and superior, is practically free, and that within the borders of that State there is no present excuse for illiteracy.

The publication of this contribution to American educational history is respectfully recommended.

Very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

History of Education in Florida.

The sixth in the Southern group of State monographs is upon "Education in Florida," prepared by Prof. George Gary Bush, Ph. D., a graduate of Heidelberg University and a winter-resident in Florida for the past ten years. His competence for the work assigned him by the editor of the series is attested by his recent and valuable History of Harvard University, published by Cupples & Upham, of Boston, in the year 1886, the two hundred and fiftieth anniversary of the founding of Harvard College. Dr. Bush is also the author of various articles published in the magazine called "Education," for example, his papers on the Origin of the First "German Universities," March, May, and July, 1884. His papers on "The First Common Schools of New England" appeared in the New Englander for March and May, 1885.

A man with such a horizon of educational interest as is indicated by the previous study of these subjects was likely to do historical justice to the educational history of Florida. Dr. Bush has taken the greatest pains with his subject, in the investigation of which there were many

obstacles and limitations. Very little pioneer work had been done in this field of Southern educational history. Materials for history were scanty. The difficulty of communicating with competent local authorities was great. Visitation was far from easy. But a very creditable piece of work has been completed and delivered to the Bureau by Professor Bush, although at one time his manuscript seemed lost past recovery in the yellow fever district of Florida, whither it had been sent in the summer and autumn of 1888 for critical revision by local authorities.

The introductory letter sent to the Secretary of the Interior from this Bureau is appended :

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., November 8, 1888.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C.

SIR: I have the honor to forward herewith a monograph upon the History of Education in Florida, by Prof. George Gary Bush, Ph. D. (Heidelberg).

This is one of the series of contributions to American Educational History, edited by Prof. Herbert B. Adams, Ph. D., of Johns Hopkins University, the preparation of which you approved by your letter of March 29.

This monograph, though written to accompany the series of historical papers upon Higher Education in the United States, treats not alone of higher education in Florida. Its purpose is to set forth, in addition, the growth and development of the school system of the State, and to emphasize particularly its rapid advance in all educational matters during the past decade.

Beginning with the earliest organized efforts to furnish instruction under the auspices of education societies, and the attempt to introduce the system of Fallenberg, a review is given of the journals of the Legislature previous to the adoption of the Constitution of 1868, and such facts are presented as bear upon the subjects of education. The legal organization of the school system, as it existed previous to the Civil War, is thus shown, together with the history of the school lands donated to the State, and the funds by which the schools were in part or wholly sustained. The point is made that the early legislation, with reference to schools, though effected largely by men of wealth, was for the benefit principally of the children of the poor.

Attention is called to the establishment, in 1852, of the first public school to be sustained by a tax levied upon individual property, and (though no uniform system had been secured) to the great improvement made during this decade in the condition of the schools.

The War era passed, the elaborate system of common schools provided for in the State Constitution of 1868, and by legislative acts in 1869, is reviewed at length, and the substance of these provisions embodied in the monograph. The favor with which the system was apparently received, and the rapidity with which the State board and the county boards were organized and entered upon their duties are touched upon; and then a history is given of the development of the system, of the opposition which it later encountered, of the lack of competent teachers, as also of school buildings and school funds, until an era of brighter promise is reached. From that period—less than a decade ago—the progress made in public school education has been most satisfactory, and it is shown that the aggregate results will bear favorable comparison with the educational statistics of any of the States. Statistics are given which place in contrast the earlier and later years, and exhibit the rapid increase in the number of schools, in pupils, and in funds. Mention is made of the valuable aid rendered to the State by annual contributions from the Peabody Fund and other agencies organized for like purposes.

The duties of the State superintendent of instruction and of the board of education, of the county boards and county superintendent, of the local trustees, and the teachers employed in the common schools are defined, and the relations they sustain to one another indicated.

The admirable work done by Northern societies, by the State, and by the agent of the Peabody Fund for the education of the Freedmen, from the year in which the War closed until schools for colored children were placed upon an equal footing with the other schools of the State, is traced at some length, while the eagerness of the Freedmen to learn and the progress they have made are noted, and a history of some of the more important schools established for them is briefly given.

During the past five years nothing else has done so much to elevate the standard of education in Florida as the efficient aid rendered by teachers' institutes and normal schools. These instrumentalities, which owe their success in large measure to the earnest labors and wise supervision of the present superintendent of public instruction, are described and their importance to the existing educational system acknowledged. Reference is next made to the academies established before the War, and to the present condition of the high schools which, with a single notable exception, do not compare favorably with schools of like name in the older States.

With a statement of the public lands received from the National Government for the establishment of "two seminaries of learning" and an agricultural college and university, the paper takes up the history of secondary and higher education. This begins with an act of the Legislature in 1851, in which it is provided that "two seminaries of learning shall be established, one upon the east, the other upon the west side of the Suwanee River." These seminaries were located the one at Ocala, later removed to Gainesville, the other at Tallahassee, and long remained the only public high schools in Florida. Historical sketches of these institutions are introduced, showing the work accomplished by them, their financial resources, the condition of the academic buildings and grounds, their educational appliances, and the character and attainments of their boards of instruction.

No public institution of Florida has passed through so many vicissitudes, or suffered so much for the lack of friends as the State Agricultural College. The endeavor has been made in this monograph to present with impartiality the facts of its history, including the acts of various Legislatures with reference to its location, establishment, board of management, and finances; and evidence is adduced to show that it is now well worthy of the patronage of the State, possessing as it does an able and energetic Faculty, commodious buildings and grounds, collections in natural history, in mineralogy and geology, a well-equipped laboratory, an experimental station furnished with excellent appliances for the study of agriculture, and a manual training school which affords practice in working in wood and metal, and the best facilities for draughting and designing. A page is devoted to the Florida University, with its meteoric appearance and brief history, to which is appended a sketch of the literary and scientific career of its founder and chancellor, the Rev. John Kost, LL. D.

The remainder of the paper is devoted to a description of the colleges founded and sustained by various religious societies, to which are added a brief mention of the State Institute for the Blind and Deaf, and references to certain schools whose aim is to furnish a good secondary education.

Of the denominational colleges, Rollins College, at Winter Park, and De Land University, at De Land, are placed in the first rank of the higher educational institutions of the State, and their history, as herewith presented, shows that in the quality of their work, the devotion of friends and increasing resources, promise is given of a successful future.

I beg leave to recommend the publication of this paper as a Circular of Information, and to subscribe myself,

Very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

History of Education in the North-West—Indiana.

It should by no means be thought that educational inquiries have been confined to the Southern States. That field was first entered because it was comparatively unexplored and promised quick and valuable returns. The first group of States arranged for under the general direction of the Bureau was the group extending along the Southern Atlantic seaboard from Virginia to Florida. The second group embraced the States now occupying the old "Territory north-west of the River Ohio;" namely, Ohio, Indiana, Illinois, Michigan, and Wisconsin. In anticipation of the historical interest likely to be awakened in the observance of the centenary of the settlement of this second block of historical work in the year 1883, that result has been practically accomplished, although for various reasons the publication has been delayed.

George W. Knight, Ph. D., a graduate of the University of Michigan, and at present a professor in Ohio State University at Columbus, was selected as sub-editor for this north central group of States, and with some local co-operation has himself compiled the parts relating to the States of Ohio, Illinois, and Michigan.¹ The two remaining State monographs in the old North-West Territory were intrusted by the editor to academic representatives of those States. Indiana was taken by Prof. James A. Woodburn, of the State University at Bloomington, who has spent several years as a graduate student in Baltimore. The peculiar interest and importance of his investigation, now in the hands of the Government Printer, is indicated by the following official letter, transmitted to the Secretary of the Interior:

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., February 27, 1889.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C.

SIR: The monograph which I have the honor herewith to submit gives a sketch of the history of higher education in Indiana. It contains an outline of the free common school system of the State, a brief notice of the State's educational history in the development of its common schools, and a historical account of the origin, growth, and development, and the present condition of Indiana's various institutions for higher education. It calls attention to the early land legislation of the Continental Congress, and to the important influence of that legislation upon the future States of the North-West; to the incidents and causes leading to the adoption of the Ordinance of 1787, and to the great importance of that Ordinance in the subsequent educational

¹ On the 27th of December, 1883, with my approval, a general introduction to the History of Higher Education in the North-West was presented by Professor Knight to the American Historical Association on the occasion of its Fifth Annual Meeting, held in the National Museum in this city. In the three days' programme of the Association, that day was the one especially devoted to the history of the North-West.

In advance of the educational experience of every important collegiate institution in the three States above mentioned, I have thought it expedient to present in another chapter of this Report the general introduction to the history of higher education in the North-West Territory.

development of these Commonwealths; and the sketch shows that from the earliest Territorial days until the present time the relation of the State to education, both elementary and higher, has been close and constant. At no time has the State acknowledged that any department of education, from the elementary schools to the university, was beyond its province.

When Manasseh Cutler, Rufus Putnam, Samuel H. Parsons, and their co-adjutors of Revolutionary days were planning the foundation for a free State beyond the Alleghanies, they held it to be the duty of the Government to give encouragement and support to religion and common schools. The West gained its first Puritan colony on the basis of this idea. Congressional endowments for schools and colleges were a part of the agreement asserted in the grant and settlement of western lands. Though the pressing financial straits of the old Confederacy may have been the decisive factor in securing the early land endowment, and though the policy of higher education by the State was not asserted by the Continental Congress, yet it is evident that no doubt existed in the minds of the Puritan colony who first settled the Ohio Valley, as to the duty and province of the State in education. They began their first State on the basis of Government aid for higher learning. This was to be like the first written line of their fundamental charter. The people have never departed from that principle. Though the principle of American republicanism, asserted by the Continental Congress as a part of the earliest law of these Territories, namely, that special favors should be shown to no particular sects or modes of worship, and that no orderly and peaceable person should be molested, either on account of his religious sentiments, or for the lack of them, yet it was none the less a part of that fundamental law that religion, morality, and knowledge are to be forever encouraged.

Religious people of various names, encouraged by the assurance of Government support in providing schools for their children, sought homes in the West. While they were yet pioneers upon the frontiers of civilization they began casting about them for ways and means to establish academies and colleges for the higher education. In the early years of Indiana history various religious denominations within her borders, with a spirit of zeal, courage, and self-sacrifice, founded institutions for the college training of young men. The Methodists established "Asbury," which has developed into the De Pauw University; the Presbyterians founded "Wabash" and "Hanover"; "Earlham" became a seat of learning for the Friends; Franklin College for the Baptists; and Butler University, founded under the name of the North-Western Christian University, became the literary care of the followers of Alexander Campbell. All these institutions from small beginnings have grown into prosperous condition. This sketch contains an account of their origin, their early conditions, and their development. The influence which they have exerted for good, in extending knowledge, and in training men and women for worthy citizenship, is beyond estimate. No one who appreciates the importance of education in a government by the people will fail to recognize the great services of these institutions to the State.

The direct work of the State in higher learning is to be especially noticed.

The most interesting phase in the history and development of education in the West is to be seen in the attitude of the State. There never has been a time when the right of government to provide for education of some kind has been called in question by any considerable body of thinking people. Both the elementary and the higher education were provided for by many of the early colonies, especially by those of New England. And from the time of the first land grant for common school purposes by the Congress of 1785, State aid to education has been an acknowledged principle of the American people, even those of the most conservative individualism conceding in some measure the right and duty of the State to educate.

As to the extent to which State aid may be carried, and in what provinces it may operate, there is to be noticed a very wide difference of opinion. The discussion on

that subject runs back at least to Plato. Between the state of the public mind on this theme a hundred years ago, and the prevailing opinion of to-day, a wide and significant difference is to be distinguished. In the public conception of the relation of the State to education there have been many changes and much growth. The evolution of the State university, one of the most recent of educational phenomena, and also one of the most interesting, is the outcome of these changing opinions. It is the origin and history of State institutions for higher learning to which this sketch directs especial attention. For this study the States of the North-West offer a productive and peculiar field. Those who are interested in studying the principle of State control of education will find in such a sketch as this some interesting illustrations and some useful experience. The educational history of Indiana will serve to show how dominant is the idea that all functions of education have come to be vested in the State.

At the time these western Territories were settled, and the first of their States was admitted to the Union, it was a dominant idea in the public mind that primary education might well be promoted by the State, but that the higher education should be left to the control of religious denominations, or to private benevolence. It was generally understood that most of the great universities of the world had been established by the church or by the king as the kind parental guardian of his people. It was forgotten that whatever church or prince had to give was derived for the most part from the people at large. Says President Charles Kendall Adams, of Cornell University: "Bologna, Paris, Oxford, Prague, Salamanca, and Cambridge were endowed in some cases by the church, in others by kings and princes, but in all cases with moneys which came directly or indirectly from the masses of the people. A peculiarity of the situation at the beginning of our national era was the fact that, while the State was inclined to keep its hold on the education of children, it appeared to be not unwilling to abandon its direction of the education of youth. In colonial and provincial days, the State, as we have seen, had all grades of education under its fostering care; but now that the churches began to contend with one another for the occupancy of the field in higher education, the State showed an unmistakable tendency to leave the endowment of the higher grades of schools to the churches. The doctrine was often put forward, and soon came to be very generally held, that the moral and religious character of students in the higher schools of learning would be unsafe unless such schools were under the direct control of the religious denominations—a doctrine built upon the singular postulate that children, so long as they are at an age that is peculiarly susceptible to religious impressions, may safely be left under the guidance of State schools, while at the moment they emerge from that age and enter upon a period less susceptible to such impressions, they must be under a more careful religious guidance than any which schools established by the State can afford."

This condition of the public mind at the time of the earliest organization of States in the North-West Territory led in large measure to decentralization of effort in the establishing and the fostering of colleges. A generation later, in the newer States, there was a tendency toward centralization in a single university. The result of the differing policies may be seen in the numerous colleges of Ohio on the one hand, and the development of the University of Michigan upon the other. Indiana illustrates the effects of these conflicting ideas. In the first part of the century her people were influenced largely by the early opinions. The tendency to-day is toward more vigorous State support and toward centralization of effort. A study of such an educational history can not fail to be profitable to the student of educational problems. President Adams points out the significant fact that there were two great statesmen of those early days who, above all, appreciated the paramount importance of the establishment by the State of institutions for higher learning; who looked forward to an education of the people, for the people, and by the people. One of these statesmen was the founder of the University of Virginia, the other entertained the loftier idea of a National University at the National Capital.

In the history of institutions for higher learning there are three phases to be easily distinguished. In the first place they may be established, endowed, and controlled by religious denominations. This has been the case with most of the great institutions of the past. The second phase is to be seen as the result of private benevolence. Clark, Cornell, Vassar, and Johns Hopkins are examples. In the third phase we see the college and the university founded and maintained by the State. President Gilman, of the Johns Hopkins University, in a recent lecture at that institution on "The Relation of the State to Education," called attention to the pertinent fact that one tendency in higher education is very largely toward State maintenance and control; and he asserted that the North-Western States offered the best field for the study of the operation of this principle. More than twenty years ago, while then a professor in Yale College, in a discussion of the question, "What sort of schools ought the State to keep," President Gilman said: "The State may say to private parties, you may maintain the schools and we will inspect them; you shall have the responsibility, and we will bestow encouragement and bounties. This would give us universal private schools. Or the State may say to the churches, you may do this work in your own religious way, and we will oversee and assist your efforts. This would give us universal parish schools. Neither of these plans stands any chance of adoption among us, at least in this generation. Again, the State may say, we will maintain schools for the destitute and neglected only, and all who can afford to pay must look out for themselves. This would establish pauper-schools—like pauper homes in the almshouses. Or, finally, the State may establish public schools adapted to the wants of all. The discussion is practically narrowed to a choice between these two conflicting theories."

The essay from which I have quoted related, chiefly, if not entirely, to the subject of common public schools for training in the elementary branches. But the same question pertained as well to schools of higher grades. Since then, we think the discussion has closed and the question, "What sort of schools ought the State to keep," is answered in the States of the North-West by the unquestioned establishment of public schools of all grades open to all the people. The history of this establishment includes the origin and development of the State university, the State normal school, and the State agricultural and mechanical institute. This sketch is a study along these lines of thought.

It calls attention also to the development and value of the common school system. A writer in the *English Westminster Review*, for January, 1837, says: "The distinguishing feature of public education in America is that it is free. Tuition in all public schools, whether elementary or high, is essentially gratuitous; in no other country has it been so clearly recognized that it is the duty of the State to provide free instruction for all the children of its people."

Émile de Laveleye, in speaking of the United States some years ago, said: "It is not simply true that every one knows how to read, but every one does read for purposes of instruction, entertainment, participation in public affairs, direction of labor, gaining of money, or investigation of religious truth. The American Union, in consequence, uses up as much paper as France and England combined. Free to all, open to all, receiving upon its benches children of all classes, and all religious denominations, the public school obliterates social distinctions, deadens religious animosities, roots out prejudices and antipathies, and inspires in all a love of their common country, and a respect for free institutions. It is the American public school which enables their people to assimilate so great a number of foreigners every year into their nationality."

The writer of this monograph believes that in no State is the American common school system to be seen to better advantage than in Indiana. The school law of the State and its practical service have attracted favorable comment from various States of the Union, and professional educators frequently accord to it precedence over the laws of all other States. The scheme upon which the Indiana system operates and its official machinery are here presented.

The monograph also traces the early struggles of pioneers to establish a public in-

stitution for classical learning, even before the State became a member of the Union. Gen. William Henry Harrison, at the "Boro of Vincennes," in 1807, became the president of the first board of trustees of the first institution of learning founded in Indiana Territory. This was the same year that Fulton's steam-boat made its trial trip on the Hudson; it was but three years after Jefferson had completed his purchase of Louisiana, an event so freighted with future consequences to the Nation; scarcely a decade had elapsed since Great Britain had withdrawn her forces from north-western soil; nearly a quarter of a century was to elapse before the opening of the National Road offered easy immigration to the West; and it was longer still till the railway and the locomotive should appear. Along the banks of the Ohio and the Wabash, and on the larger interior streams lived a few thousand whites, while many Indian tribes lived in rude huts on the river banks, or roamed the forests of the Territory. Tecumseh and the Prophet were yet to reach the fulness of their power.

In these days, as this sketch shows, with the howl of the wolf within hearing of their homes and the smoke of the wigwam within sight, the boys of the hardy settlers were learning to read "*arma virumque cano*." The story of these times is surely not uninteresting in the history of education.

I respectfully recommend that this valuable monograph be published at the earliest possible day.

I have the honor to be, sir, very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

History of Education in Wisconsin.

The Wisconsin monograph was executed under the supervision of Prof. William F. Allen, of the University of Wisconsin, by one of his advanced graduate students, Mr. David Spencer, who, amid the rich historical collections of Madison, had excellent materials for his constructive work. The accompanying letter, submitted when the monograph was officially approved for publication by the Secretary of the Interior, will suggest the general interest and character of the work:

DEPARTMENT OF THE INTERIOR,
BUREAU OF EDUCATION,
Washington, D. C., October 25, 1883.

The Honorable THE SECRETARY OF THE INTERIOR,
Washington, D. C.

SIR: I have the honor to transmit herewith the manuscript of the History of Higher Education in Wisconsin. The preface will explain the nature of this work, which was prepared under the supervision of the most accomplished historian of the West, Prof. William F. Allen, of the University of Wisconsin, aided by Mr. David Spencer, one of the instructors in that institution.

This is the first of a series of monographs relating to higher education in the group of north-western States composed of Ohio, Indiana, Illinois, Michigan, and Wisconsin, and was undertaken with the approval and by the direction of the Hon. L. Q. C. Lamar, late Secretary of the Interior. It will prove a very valuable addition to the educational history of the country.

I respectfully recommend that the same be printed as a Circular of Information of this Office.

Very respectfully, your obedient servant,

N. H. R. DAWSON,
Commissioner.

Object of this Series of Monographs.

The foregoing abstracts and illustrations of completed monographs will show the nature of the work now in progress. A third block of States in the South-West and along the Gulf of Mexico has been distributed among competent educational specialists, resident in or native of that region. A fourth and larger group is that beyond the Mississippi and including all the States between that river and the Pacific Ocean.

The educational history of each State has been intrusted to competent hands, and the returns already promise a rich harvest of interesting experience. Whoever writes the history of schools, colleges, and universities in any of the States of the American Union necessarily writes, to a considerable extent, the history of culture and social progress in that State; for with educational institutions is bound up more of the intellectual and moral interests of the Commonwealth than with any other class of public institutions, excepting perhaps the church. Among all the peculiar and splendid provisions of that justly celebrated Ordinance of 1787, passed by the aid of Southern votes in the interest of north-western colonization, there is nothing grander than the words, "Schools and the means of Education shall forever be encouraged" (Journal of Congress, IV, 753). Educational and moral forces were extended across a continent by the instrumentality of good laws, and by the efficient service of pioneers in the church and state. This movement forms a chapter of American history not yet fully written, but it is worthy of a special investigation and literary treatment.

The aim of this series of documents is to present the educational history of the several States in such a manner as to awaken or revive among our citizens an interest in the great work of education, while affording suggestions of practical value to those actually engaged therein.

The monographs thus far published have been received with singular favor by all real friends of popular education, whether in its rudimentary or higher forms. Particular pains have always been taken to show the intimate and necessary relation between the higher sources of learning and the broadening rivers of popular instruction. Although the special object of the series is to trace out the history of colleges and universities in regions where such a task has never before been systematically attempted, nevertheless considerable attention has been given to common schools and secondary education. Some day, perhaps, these latter veins of popular interest will be worked more fully, although there can hardly be such picturesque variety of interest as is afforded by our American colleges and universities.

If the history of higher education in the West and South is almost unknown, because it is not yet written, the colleges of New England and of the States along the Northern Atlantic sea-board have, in most cases, an established fame and, in some cases, an extensive literature. In fact, the materials are so rich and voluminous that there is an em-

barrassment of riches for any investigator in these ancient fields. And yet there is great need of compact and readable accounts of the higher educational experience of States like Massachusetts, Connecticut, New York, New Jersey, Pennsylvania, and Maryland. Most of the published histories of Northern colleges are burdened with an excess of personal and antiquarian details of no permanent interest, except perhaps to the trustees, faculty, and alumni of individual colleges. The histories of educational institutions, like the histories of towns, are sometimes written for a peculiar constituency. The monographs, prepared under the national auspices of the Bureau of Education, are intended not so much for the benefit of particular institutions as for the average and enlightened citizen, in short for the greatest good of the greatest number. Accordingly, the local history of our older colleges will be rewritten from State and National points of view. An attempt will be made to give the salient features in the higher educational life of New England, New York, and Pennsylvania. While holding the larger public interest in mind, the various writers will endeavor to make their reports truly representative, although within modest limits.

Throughout the entire series these main ideas have been emphasized:

(1) The higher education, without neglect of primary and secondary interests.

(2) Presentation of the subject in State monographs, at once representing the highest educational aims while conserving local and sectarian interests.

(3) Illustrations of monographs by plates and engravings, showing pictorially the institutions described, with their libraries, laboratories, and educational apparatus, as well as their external architecture.

(4) Bibliographies, indicating to students and future historians of American education the routes already traversed, suggesting the wealth of material still available, and showing to all special enquirers the way to fuller information on subjects that may be briefly sketched.

(5) Description and narrative, rather than mere mathematical statistics, which have their proper place in the Annual Reports of the Bureau of Education, but are not so appropriate for other kinds of publication.

(6) State unity, with local varieties in the grouping of higher educational institutions.

(7) The representative principle in the selection of writers and the treatment of institutions.

(8) Co-operation in the composition of State monographs.

(9) Editorial direction and critical supervision of all State returns, so that the treatment of institutions shall be in due proportion and in a strictly historical spirit.

(10) Responsibility to the Bureau of Education and the greatest possible economy in the conduct of the work.

All these principles, to the best of my knowledge and belief, have been faithfully and conscientiously observed. The work was begun

and has been carried forward by the Bureau for three years without any increase in its annual appropriations, and strictly within the letter and spirit of the law under which the Bureau was originally created. This Office was established in the year 1867 "*to collect statistics and facts showing the condition and progress of education in the several States and Territories.*" While the collection of educational statistics is one of the primary duties of the Bureau, the gathering of historical facts which alone can illustrate the educational progress of the country is a duty no less important. Indeed, the modern conception of "statistics," as developed by the present Commissioner of Labor, Col. Carroll D. Wright, is the *historical* conception. He said, in his Cambridge address to the American Historical and Economic Associations: "*The statistician writes history. He writes it in the most concrete form in which history can be written, for he shows on tablets all that makes up the commonwealth.*"

History of Federal and State Aid to Higher Education.

A more comprehensive research than any of those hitherto described has been prepared by Mr. F. W. Blackmar, of California, upon the subject of "Federal and State Aid to Higher Education in the United States." It is a comparative historical study of the policies pursued by the several States and the Nation at large in regard to the support of advanced learning. It does not assume to be a history of education in the United States, nor even the history of State institutions of a high grade, but rather *the history of the relation of the state to higher education.* The history of education is a history of ideas, of which the function of the state in advanced learning may be considered as one. The monograph aims to trace this idea in its development, and in its various relations and applications throughout the educational history of our country. To do this successfully requires careful discrimination as to what higher education really is; and as all the facts within the scope of the subject in hand can not be reproduced without enlarging the work to undue proportions, care must be exercised in selecting the material best adapted to clearly present the subject. In order to present the paper in a condensed form statistics have been freely used, which, though they may not give a high coloring to the work, will certainly enhance its usefulness to statesmen and educators.

The first part of the monograph treats of what may be termed national education. It presents in brief, early colonial education in general, the several policies of the States, the attitude of the country at large, and the rise of the national idea in education. It discusses the function of the state in higher education as shown in the sentiments and lives of the foremost statesmen and educators of the nation, and recounts the recent history of national education.

After reviewing the history of the great legislative acts, among which the Ordinance of 1787 and the Act of 1862 are most prominent, the sig-

nificance of such institutions as the National Museum, the Congressional Library, the Bureau of Education, the Military Academy at West Point, and the Naval Academy at Annapolis is clearly shown by statistics and brief historical sketches.

The second part of the monograph is composed of short papers representing the attitude of the several States toward education and the methods adopted in their treatment of the subject. Each State is treated in its turn separately, though not without reference to others, and the principal historical facts are given relative to the protection, encouragement and support of higher education since the founding of the colonies to the present time. While the financial and legislative parts of the history receive the greater attention, sufficient collateral history is given of the institutions treated to bring clearly before the mind of the reader the several methods followed in the management of advanced education:

In short, the monograph shows in just what manner and to what extent the various States and the Federal Government have supported higher education by constitutional and legislative enactments and by appropriations and grants. One of the important conclusions reached as the result of this research is that, through a century of struggles, with alternating success and failure, the ideas pertaining to State education have been slowly crystallizing, and there is every appearance that the hopes of the early fathers on this subject will ultimately be realized.

The introductory letter transmitting the manuscript to the Secretary of the Interior from this Office is as follows:

WASHINGTON, D. C., *February 19, 1889.*

SIR: I have the honor to transmit the monograph on Federal and State Aid to Higher Education in the United States, prepared by Mr. Frank W. Blackmar, fellow in history and politics in Johns Hopkins University, which represents the progress of the State idea in education from the foundation of the colonies to the present time. It shows the attitude of each colony and of each subsequent State towards colleges and universities, and recounts that part of the legislative and financial history which relates to advanced learning in the several commonwealths. The writer discusses the rise of national education with its relation to local, and brings forward the opinions of statesmen and scholars concerning the duties and functions of the Government in public education. A brief history, accompanied by valuable statistics, is given of the various methods adopted by Congress to encourage and assist institutions of learning. But the main body of the work is devoted to the presentation in a condensed form of the plans pursued by the legislatures of thirty-eight States in the treatment of higher education. The monograph represents a wide range of research extending from the earliest colonial records and charters to the latest revised statutes.

Many inquiries of late coming from statesmen and educators, for information on this subject, have created a demand for a work on this nature. There is a desire on the part of the scholars of each State to see what has been done in other States, that mistakes may be avoided by experience and the best plans and models followed. There is likewise a general desire for a closer study of school management and school systems, based on wider information and more careful comparison of methods and results. The financial and legislative history of education furnishes a foundation for

such study and comparison. The successful management of the means of education is of prime importance; without this there is danger of complete failure. The control of the budget is the control of the state; this principle applies to institutions as well as to nations. State education has taken a strong hold particularly in the South and West, but the problems pertaining to its management, its function, and its support have not yet been fully solved.

To bring the results sharply and clearly before the reader statistics have been used quite freely, while to bring the monograph in small compass much interesting and instructive material must be passed by which would find its way into a general history of education. Statistics and cold facts, after all, are the most enduring portion of history, and will remain, if collected with care and with a single aim to recount the exact truth whatever be the consequences, when the colored light that men have thrown on truth in the name of history has disappeared. "The statistician," says the Hon. Carroll D. Wright, "chooses a quiet and may be an unlovely setting, but he knows it will endure through all time." This monograph was written with an earnest desire to present facts unbiased by any desire to prove a particular thesis.

History of this sort ought to help us to better understand our educational work as it is; it ought to dispel illusions and fortify truth. As Americans we are accustomed to indulge ourselves in a largeness of sentiment that borders on boasting when we speak of our educational institutions. It is a favorite pastime with many to imagine that their particular local institution is the best in the State, or possibly in the Nation, and that our system of higher education is equal if not superior to any in the Old World. The criticisms of men like James Bryce and the late Matthew Arnold, though unfairly presented, are in the main true, and are exceedingly helpful toward a better understanding of our position. When applied to education they ought to goad us on to a higher culture and to a more elevated standard. It is idle to deceive ourselves, by making ourselves appear greater than we are, while there are so many poorly endowed and half-equipped colleges and universities in our country, and so many thousand illiterate citizens in our midst.

To bring the work of the several States into comparison tends towards unity of sentiment and unity of design in education, and these make for patriotism and nationality. The influence of a single university on the founding and organization of others is well illustrated by such an institution as the University of Virginia or as the University of Michigan. A constant and persistent publication of the history of higher education in all of its phases will do more to harmonize our educational systems than almost any other thing. As a means of levelling local distinctions it is next to a university composed of men from all parts of the United States. Higher education needs to be centralized and harmonized.

One of the strongest inferences that may be drawn from this investigation is, that in nearly every instance the foremost desire of the people has been for colleges and universities rather than for schools of a lower grade. It was the opinion of the colonists and of the later settlers of the West and South that primary and secondary schools were essentially dependent for their existence upon higher institutions. This principle is borne out by the facts, for then, as now, wherever the best colleges and universities are there will be found the best grade of primary and secondary schools.

It is not uncommon to hear persons speak of common schools and the university as if they were entirely disconnected and what concerns one did not the other. Our fathers meant by a "common" or "free" school, one that was open to all persons on equal terms, and not necessarily a school of low grade. The meaning of the terms have changed, but it would be well to return to their primitive signification, and consider all schools, colleges and universities, high schools, secondary and primary, whether State or non-State, as schools of the people; and to consider further that what affects one class affects all, and that to build up and strengthen learning is the safest plan for insuring the perpetuity of primary and secondary schools.

This monograph was prepared at the request of the Bureau of Education, by the

author, under the supervision of Dr. Herbert B. Adams, of Johns Hopkins University, and is one of the series upon the history of higher education in the United States, and was authorized by you. I respectfully recommend its publication.

Very respectfully yours,

N. H. R. DAWSON,
Commissioner.

Hon. W. F. VILAS,
Secretary of the Interior.

Action of the National Educational Association.

At the meeting of the Department of Superintendence, March, 1889, the following resolutions, approving the recent work of the Bureau, were passed:

Whereas, The Bureau of Education has begun a systematic inquiry into the Higher Education in the United States, and has already published a series of valuable monographs upon the history of colleges and universities in various States of the American Union; and

Whereas, The Bureau has extended its inquiries into the higher educational history of the North-West, and into the historic relation of the Federal and State governments to Higher Education:

Resolved, That the Department of Superintendence cordially approves of this work, so successfully begun, and recommends its continuance throughout the American Union, and its extension to the history of secondary education, as well as the speedy publication of the monographs now on hand.

CONCLUSION.

The manuscript of this Annual Report was completed nearly three months sooner than that of the previous year, and was transmitted to the Secretary of the Interior February 25, 1889. The Report for 1886-87 was sent to the printer on the 16th of May, 1888, but was not printed and delivered to the Office until the 4th of January, 1889. I repeat, that the printing and binding of this Report should be conducted with greater dispatch.

I also call attention to the fact that the edition of this Report is entirely too small to be distributed to the large number of those interested in education, and to whom it has become almost a necessity in the conduct of their work.

In concluding this Report, I again beg to express my obligations to its correspondents, and to the friends of education generally throughout the country, for the ready and cheerful assistance which has been rendered in reply to all demands that the Office has made upon them. Without their assistance and ready co-operation the annual reports of this Office could not be prepared.

In the administration of the high duties of the Office, the catholic rule has been observed of extending its benefits to all sections of the country, without regard to creed, race, or party. In this course I have pursued the policy of this Office under the administration of my predecessors, and the spirit of the legislative enactments of the Govern-

ment. If there is one public office whose precincts should be sacred from the intrusion of sectarian or partisan prejudice growing out of the political struggles which convulse the country, it is the Office of Education.

I also beg to acknowledge my indebtedness to the employés and clerical corps of the Office, who have so intelligently performed their duties. To the Chief Clerk, Chiefs of Divisions, and all others in the Office, I renew my thanks for their hearty aid and respectful kindness and consideration; and to you I beg to return my thanks for the interest you have manifested in the work of education during your administration, and for the uniform courtesy shown me personally and officially.

I have the honor to be, very respectfully, your obedient servant,
N. H. R. DAWSON,
Commissioner.

Hon. W. F. VILAS,
Secretary of the Interior.

TO THE MEMORY OF CHARLES WARREN.

While this volume was going through the press occurred the death of Dr. Charles Warren, the Statistician of this Office, on the 9th of September, 1889.

Dr. Warren was appointed Chief Clerk of the Bureau of Education by General John Eaton, when the latter became Commissioner in 1870. In 1881 he was transferred to the position of "Statistician" of the Bureau, which he continued to hold to the day of his death.

A lover of books, and of more than ordinary culture, he was able to be of great service, not only in directing the routine duties of the Office, but in suggestions relating to its publications, and in the occasional preparation of circulars of information.

His geniality of disposition, equable temper, and kindliness of heart secured for him the attachment of his associates, and the esteem in which he was held by them will cause his death to be felt as a personal affliction.

As a mark of respect to his memory the Bureau of Education was closed on the afternoon of his funeral, by the order of the Secretary of the Interior.

CHAPTER III.

STATE COMMON SCHOOL STATISTICS.

Preliminary Remarks—Population Statistics (Table 1)—School Age and School Census (Table 2)—Enrolment (Table 3)—Average Daily Attendance (Table 4)—Total Attendance; Length of School Term (Table 5)—Number of School Buildings; Seating Capacity (Table 6)—High Schools (Table 7)—Private Schools (Table 8)—Teachers (Table 9)—Salaries of Teachers (Table 10)—School Revenues (Table 11)—School Revenues Reduced to a Per Capita Basis (Table 12)—Percentage Classification of School Revenue (Table 13)—School Expenditures (Table 14)—School Expenditures Reduced to a Per Capita Basis (Table 15)—Percentage Classification of School Expenditures (Table 16)—Permanent School Funds, Total Assessed Valuation, and Valuation of School Property (Table 17)—Chief State School Officers (Table 18).

PRELIMINARY REMARKS.

Statistical returns in whole or part for the year 1887-88 were received in time for insertion in this Report from thirty-seven States and Territories, including Georgia and Louisiana, whose returns for the calendar year 1887 are given. Nine States and Territories are represented by returns for 1886-87, one (Delaware) by a return for 1885-86, while for New Mexico the census of 1880 still furnishes the latest complete statistics that can be obtained.

The summaries for the United States and its different geographical divisions, therefore, are not for any particular date, must be considered as furnishing the latest aggregates available of enrolment, expenditure, etc.

In regard to the reliance to be placed upon the tables of State school systems much remains to be desired. Some of the causes tending to impair their trustworthiness were set forth in the last Report of this Office. No considerable improvement has been made in this respect. There is, in general, the same want of uniformity in methods, and in several cases the returns contain internal evidence of being highly incorrect. Of course these causes affect the value of the summaries and averages made.

Moreover, it is apparent that no aggregate of enrolment, attendance, or expenditure can be made for the United States without a return from every State. In no case, however, is it, or has it ever been, possible to make such an aggregate from actual returns. Estimates on the best basis practicable have to be made to fill out the blanks in the most important columns. It is believed that the errors resulting from these estimates are considerably less than those due to the causes mentioned in the preceding paragraph.

On account of these considerations the results obtained by the Bureau must be considered as mere approximations. Still by a careful study of them much valuable information may be obtained, and many conclusions drawn that are unmistakable. The lines along which the greatest development is taking place are plainly indicated.

POPULATION STATISTICS—HOW COMPUTED.

The mode of computing the statistics of population given in this table was fully set forth in a previous Report (1885-86, pp. 22-3).

The United States census of 1880 is taken as a basis; the rate of increase from 1880 in each State is assumed to be the same as the rate of increase of the school population as determined by the school census, where one is taken, which is now the case in all but eight of the States and Territories. Where the enumeration of the school population is correctly made each year or at stated periods, the total population, or the population of any specified ages, can be computed for any given date with sufficient accuracy for all practical purposes.

Where there is no school census the rate of growth from 1870 to 1880, or from 1860 to 1880, is assumed to be continued on into the present decade. Of course such an assumption may not be warranted by the facts, and may lead considerably astray. But it has been deemed the best one for the purpose, and in any case it is better to use the population so computed than to use at this late date the old figures of 1880.

h Excluding Alaska.

SCHOOL AGE AND SCHOOL CENSUS.

There has been no change in the school age of any of the States or Territories during the year for which the returns are tabulated.

Thirty-seven States and Territories show an average increase of 2.20 per cent. in the school population. This is probably less than it should be. Ohio, Indiana, and Oregon all report a decrease of school population, when there is every reason to suppose that in such rapidly growing States there has actually been an increase. State Superintendent McElroy, of Oregon, attributes the apparent decrease in that State to the effect of a new law, under which duplicate enumerations are avoided, and therefore a more correct census is taken.

a These statistics are for 1886-87.*b* No school census.*c* Excluding the county of San Francisco.*d* It is estimated that there are 12,000 persons under twenty-one years of age.*e* Only those States for which the increase or decrease is tabulated enter into this summary.

ENROLMENT.

The total number of pupils enrolled is reported at 11,952,204, and the annual increase 234,776, showing a growth of two per cent. per annum.

Here, also, as in the case of school population, there are probably some deficient reports; Indiana and Iowa both show a heavy decrease, 6.92 per cent. in the former case and 2.27 in the latter. On the other hand, in some States, as in Minnesota and Nebraska, there appears to be an abnormal increase.

Still, after taking all these circumstances into consideration, there seems no reason to doubt that the relative increase of school population and enrolment for the United States (2.20 and 2 per cent. respectively) is substantially as given in the tables, *i. e.*, that the school enrolment is not increasing as fast as the school population; this is apparent again from the footing of Column 5, where it is seen that 20.10 per cent. of the total population are enrolled in the public schools, as against 20.33 per cent. given in the Report of this Office for 1886-87.

It will be instructive to compare these conclusions with the results deduced from the tables given on pp. 90-92 of the Report just referred to. It was there shown that during the ten-year period ending with 1887 there had been a decrease in the population of children enrolled in the public schools in all except the South Atlantic and South Central Divisions. It would seem now that the growth of the public school system in the Southern States has nearly attained its maximum, after having reached a point in its development considerably below that occupied by the Northern States, as will appear from the summaries of Column 6 of the following table. The statistics of one year, however, can-

not be relied upon to furnish a final determination upon this point, but need further confirmation. It is certain, however, that the public schools of the South are not growing at the rate they were during the ten years referred to.

It would be desirable to know if the falling-off in the public school enrolment were compensated by the increase in private school enrolment. On this point private school statistics are too meagre to furnish definite information.

In fourteen States and Territories the average increase of the private school enrolment was 6.98 per cent. (Table 8, Column 6), a quantity much larger than the public school increase in the same States.

The most complete and trustworthy data upon this head, however, are furnished by a group of States comprising Massachusetts, Rhode Island, Connecticut, New York, and New Jersey. In these five States the school population increased 1.03 per cent. during the last year reported, while the public school enrolment increased only 0.28 per cent., the actual increase being 4,938. But in the same States there was an increase in the private school enrolment of 12,956. If these were added to the increase of public school pupils, there would result a total increase of pupils attending some kind of school of 17,894, or 1 per cent., which is nearly equal to the increase of school population. It may be said, therefore, that in these five States the proportional number of children attending some school, public or private, has not perceptibly decreased.

The conclusion presents itself, then, that in these States, and presumably elsewhere, there is going on a transfer of pupils from the public to private schools. This circumstance is of the greatest significance and demands careful consideration. The public schools are supplied with better teachers and better material appliances for education than ever before, and more money is expended upon them. The cause of their retrograde movement in the older States of the North, if such exists, is to be sought for in connection with conditions arising from the growing complexity of our civilization and the development of ever greater extremes of wealth and poverty, but chiefly, perhaps, from the increasing prevalence of a belief in the necessity of certain forms and subjects of instruction that the public schools do not or can not give.

AVERAGE DAILY ATTENDANCE.

The latest returns of the average daily attendance of pupils throughout the United States in public schools aggregate 7,852,607, with an increase over the preceding year of 200,860, as nearly as can be ascertained, or 2.62 per cent. The increase has been estimated for eleven States and Territories, but the total probably does not exceed what it should be, unless the tabulated increase for West Virginia, Florida, or Colorado is too large. The large increase in South Carolina arises from the reopening of certain schools which were closed the preceding year. Eight States show a decrease, which is probably incorrect in some.

The fact that the increase of average daily attendance (2.62 per cent.) is greater than the increase of enrolment (two per cent.) can only be explained on the supposition that the children who do go to school attend more regularly than formerly; and, moreover, so great is this increase in regularity of attendance that it has been sufficient to neutral-

ize, or mask, the falling off in the percentage of the school population enrolled, noted in connection with the preceding table; so that while fewer different children go to the public schools, the schools are actually more largely attended than before.

This same increasing regularity of attendance was shown in the last Report of this Office (1886-87, p. 61) to have been going on since 1876. The present figures confirm the existence of this movement, and tend to establish its continued operation. The number of pupils attending on an average for every one hundred enrolled increased from 60.31 in 1876-77 to 64.13 in 1886-87, and is now (Column 7 of the following table) 65.70.

Column 8 of Table 4 gives the average number of pupils to a teacher, and is based on the number of teachers necessary to supply the schools. Nineteen States report this latter quantity, and in those States the average number of pupils to a teacher is 24.32. The fewest teachers are found in the District of Columbia, while they are most abundant in Dakota, the general rule being that there are the most teachers in the least thickly settled communities.

TOTAL ATTENDANCE; DURATION OF SCHOOLS.

The aggregate number of days attended by all pupils appears in Column 2 of the following table.

This is a fundamental quantity, which should be obtained directly from teachers' reports by a continued process of summing up, and not by operating upon any other quantities. It forms the basis of the most important statistical inquiries relating to attendance.

Reports apparently trustworthy and complete of the aggregate attendance in days have been received from twelve States. From these it has been computed that the aggregate schooling given in those States was sufficient to have given every child six to fourteen years of age 103.5 days. Of course the introduction of reports from other States would change this average. The average number of days' attendance of each pupil enrolled was 93.7 days, in the same States.

The average number of days the public schools were kept, so far as reported, was 129 days (Column 5). In this computation those States were omitted in which the average duration of all the schools was not reported or could not be computed. Each State, as in all averages of this character, was given a weight proportionate to its number of schools. The result embraces thirty-eight States and Territories.

The increase or decrease in the length of time the public schools were kept (Column 6) has been ascertainable in thirty-two States and Territories. Some States have lengthened their school term, others shortened it, in some cases to a considerable extent. The general resultant of all these movements, however, has been an advance of seven-tenths of a day for all the States entering into the inquiry.

It is known that the methods used in computing the average length of the school term are not uniform, and that in some of the States erroneous results are obtained. For these reasons the statistics relating to the length of the public school term are not entitled to the credit that appears to attach to them. It can only be said that we have reached a more or less close approximation of the number of days the public schools were kept, and that there has probably been no material change during the past year.

TABLE 5.—*Total Attendance in Days upon Common Schools, mainly for 1887-88, compared with the population 6 to 14, and with the enrolment; Average length of public school year in days, mainly for 1887-88, compared with same for preceding year.*

a These statistics are for 1886-87.

b These statistics are for 1888.

c These statistics are for 1887.

d White schools.

e These summaries embrace only the States tabulated in the corresponding columns above.

NUMBER OF SCHOOL BUILDINGS; SEATING CAPACITY.

The number of school buildings in the different States is given in Column 2. Where the number of buildings has not been reported the number of schools is substituted, and in one case the number of districts, as affording the best approximation that could be obtained. The aggregate for the United States is 219,963.

The total number of sittings is reported from thirteen States. The average number in these States to each one hundred pupils enrolled is 118, to each one hundred in average attendance 187, and to each school building 66.

The District of Columbia shows the greatest deficiency in school accommodations, though a considerable increase over last year.

HIGH SCHOOLS.

It will be seen from the accompanying table that the statistics of public secondary education are very incomplete, and, moreover, lack uniformity. This is perhaps an unavoidable defect. What a "high school" pupil is admits of no precise definition. Hence the incongruity of such returns as are given from Mississippi and Louisiana. The abnormal increase in the high school enrolment of Minnesota is probably due to incorrect returns.

In seventeen States the high school enrolment forms 3.5 per cent. of the total public school enrolment; or, in other words, thirty-five pupils out of every thousand are high school pupils. The greatest development of public secondary education has apparently taken place in the North Atlantic group of States, since five of these States show an average of sixty-four pupils, out of every thousand, receiving a public high school education.

^a Estimated.^b These summaries embrace only the States tabulated in the same columns above.

PRIVATE SCHOOLS.

The reports of private schools are considerably fuller this year than the preceding one. In one division, the North Atlantic, all the States but two are represented.

The increase of the private school enrolment, compared with that of the public schools, has already been referred to (p. 83).

Column 5 gives the proportion of pupils who attend private schools. In 20 States and Territories 9.38 per cent. of all pupils, on an average, or nearly one-tenth, are private school pupils. It will be observed that, so far as known, private schools have received a greater development in the Northern States than in the Southern, and in the older States than in the newer.

The necessity of securing statistics of private schools continues to receive attention. State Superintendent Thayer of Wisconsin says upon this point: "Until all institutions of every grade that engage in the instruction of persons of school age in the State are required by stringent legislation to report annually at least the number thus instructed, it will be impossible to ascertain with accuracy the proportion of our school population which is failing to secure an elementary education. Every person or association of persons receiving pupils between the ages of four and twenty years for instruction should be required to register the name, age, days of attendance, and studies pursued by each pupil, if a resident of the State, and annually furnish an abstract of the record thus taken."

SUMMARY.

a Estimated.
b Includes expenditure for libraries and apparatus.
c Not reported.
d School books and supplies.
e Includes board, fuel, and care of fires and school-houses.
f Increase in salaries of teachers only.
g These statistics are for 1886-87.
h Cost of tuition.
i Standing debt paid.

j Included in "other expenses."
k These statistics are for 1885-86.
l Salaries of teachers only.
m There were also expended \$5,181 for night schools.
n These are statistics for 1887.
o As far as reported.
p A few counties not reported.
q Amount of receipts.
r Includes funds for support of normal schools.

t Meagre estimate for country schools.
u Including rent of school-houses.
v Includes salaries of city superintendents.
w These statistics are for 1889.
x An estimate embracing all the States in the group to which it belongs.
y States not tabulated in the same column above are excluded from this summary.
z Excluding Alaska.
aa In the city of Wilmington.

aa In the city of Wilmington.

TABLE 15.—*Expenditure for Salaries of Superintendents and Teachers and Total Expenditure, mainly for 1887-88, reduced to a per capita basis; also the number of mills per dollar of assessed valuation expended for the same purposes.*

a Fund in 6 per cent. bonds, yielding a revenue of \$25,000.

b Value of school-houses only.

c 400,000 acres of land.

d Approximate.

e Maximum estimate.

f These statistics are for 1887.

g There are also some school lands, value not reported.

h Also 7,000,000 acres of land leased.

i 21,000,000 acres of land.

p Estimated.

q Also school lands estimated at 1,537,618 acres.

r Also 1,215,728 acres of land.

s These statistics are for 1880.

t Proceeds of sales of lands held for investment.

u Only the States tabulated in the same column above are included in this summary.

v An estimate embracing all of the States of the group to which it belongs.

TABLE 18.—*Chief State School Officers.*

[NOTE.—This list has been revised to date of going to press.]

Name.	Address.	Official Title.
Solomon Palmer.....	Montgomery, Ala....	State superintendent of education.
Woodville E. Thompson	Little Rock, Ark....	State superintendent of public instruction.
Ira G. Hoitt	Sacramento, Cal	Do.
Fred Dick	Denver, Colo	Do.
Chas. D. Hine.....	Hartford, Conn.....	Secretary of State board of education.
A. N. Raub.....	Newark, Del	President of State board of education.
Albert J. Russell.....	Tallahassee, Fla	State superintendent of public instruction.
James S. Hook.....	Atlanta, Ga	State school commissioner.
Richard Edwards.....	Springfield, Ill	State superintendent of public instruction.
H. M. La Follette	Indianapolis, Ind....	Do.
Henry Sabin.....	Des Moines, Iowa....	Do.
J. H. Lawhead.....	Topeka, Kans	Do.
Jos. Desha Pickett	Frankfort, Ky	Do.
Joseph A. Breaux.....	Baton Rouge, La....	State superintendent of education.
Nelson A. Luce.....	Augusta, Me	State superintendent of common schools.
M. A. Newell.....	Baltimore, Md	State superintendent of public instruction.
John W. Dickinson	Boston, Mass.....	Secretary of State board of education.

CHAPTER IV.

DIGESTS OF STATE SCHOOL REPORTS.

ALABAMA.

[From Report for 1887-88 of State Superintendent Solomon Palmer.]

GENERAL STATEMENTS.

Superintendent Palmer states that during the year 1887-88 he visited twenty-one counties of the State for the purpose of inspecting the schools and organizing teachers' institutes, and that he found the schools in a reasonably good condition, that officers and teachers were making great efforts to make the schools as successful as possible with the small amount of funds at their disposal, and that the public schools are so increasing in popularity that every one now admits that they are indispensable to the prosperity and happiness of the people.

"Notwithstanding the difficulties that our public schools have had to encounter in the past, they have accomplished much good in giving the rudiments of an education to thousands who, without them, would have grown up in ignorance to swell the already long list of illiterates that are a blot on the fair name of our State. Many who have received in these public schools all the instruction that they have ever received or will ever receive, will grow up to noble manhood and lovely womanhood, to honor the State and to bless their race, indebted to our public school system for all the good they accomplish in the world."

NEED OF INCREASED FUNDS.

The great need of the schools since the establishment of the public school system has been a sufficient amount of funds; but now, when the value of property is increasing so rapidly and capital is pouring in from other States, it is absolutely necessary that the schools be placed upon a firm foot-hold. Heretofore when it has been asked that more money be appropriated for the benefit of the schools, the reply has always been that there were no funds in the treasury, and that the people could not bear a heavier burden of taxes than that already imposed; but this answer can no longer be given, for at the close of the last fiscal year there were more than half a million of dollars in the vaults of the State treasury, and the auditor recommends that the tax rate be reduced ten per cent. in order to avoid the accumulation of a surplus. The tax rate at present is only five mills on the dollar, or 50 cents on a hundred dollars' worth of taxable property, and there is no complaint of heavy taxes, but there is a strong demand from all parts of the State for much longer school terms and a better class of teachers at good salaries. At present the schools are kept open on an average only a little more than three months, and the teachers are paid only \$22 dollars per month; but if the tax rate is kept at five mills, the appropriation for schools can safely be increased from one hundred and fifty thousand to two hundred thousand dollars more than the sum now appropriated.

By a comparison of statistics Superintendent Palmer shows that Alabama is not doing near so much for public schools as the other Southern States similarly situated, and when compared with the Northern and Western States, the difference is much greater still.

"It would be a waste of time to attempt to show the advantages arising from a good public school system. All thoughtful persons admit that in a republican form of government, such as ours, a public school system is indispensable to its perpetuity. If called on for an argument in their favor I need go no further than the constitution of our own State to show that it is the sworn duty of the General Assembly to establish, organize, and maintain a system of public schools throughout the State for the equal benefit of the children thereof between the ages of seven and twenty-one years. For the

benefit of those who may doubt the propriety or wisdom of larger appropriations for our public schools, I will remark that every State in the Union, and every country, worthy of the name, on the globe, have organized and are now maintaining at the public expense a school system for the education of the young. The question is not whether we shall have a public school system—that is settled by our constitution, by the custom of all civilized countries—but whether we shall have a public school system equal to the demands of the times, and that will not suffer in comparison with the systems of other States.”

The greatest difficulty encountered by the State commissioner of agriculture and immigration on his recent trip to the North to induce immigrants to come to the State was the poor facilities for education as compared with those of the Northern States. It is desirable to secure as immigrants those persons who value highly the educational facilities of a country, and not the ignorant and lawless who have no regard for the future welfare of their children.

CONSTITUTIONAL AMENDMENT.

The constitution and statutes of the State expressly forbid any portion of the school money to be used to build or repair school-houses, and according to a decision of the Supreme Court no special tax can be levied for school purposes in townships or school districts, and not more than five mills can be raised in counties, cities, towns, or other municipalities for general purposes, and as all the funds thus raised are usually needed for current expenses, nothing is left for the public schools. In many of the States a large portion of the public funds is raised by local taxes. A special tax of three mills for school-houses and furniture is very badly needed, and the superintendent recommends that a constitutional amendment be submitted to the people authorizing and requiring a special tax by each county for school purposes of not less than two nor more than five mills on a dollar's worth of taxable property, and that townships and separate school districts be authorized to levy and collect a school tax not to exceed five mills on the dollar.

POLL-TAX.

Township superintendents have always had great difficulty in estimating how much money from poll-taxes would be available for school purposes during the year, and consequently some county superintendents have refused to approve contracts made with teachers, while others have approved contracts for larger amounts than were realized. To overcome this difficulty the superintendent recommends that the amount of poll-tax collected each year in each township and separate school district be made the basis of all contracts for the succeeding year.

COUNTY SUPERINTENDENTS.

The present law making it the duty of the State superintendent to appoint the county superintendents was enacted in 1877, but there has always been some dissatisfaction with it, and special acts have been passed from time to time permitting the superintendents of different counties to be elected by the people, until now we find twenty-three counties electing their superintendents who qualify at different times, thus causing much confusion and irregularity in the administration of the schools. It is very desirable that a uniform system be adopted, either requiring all to be appointed or all to be elected at the same time.

Superintendent Palmer thinks that it would prove for the best interests of the schools and give more general satisfaction to the people if the county superintendents were elected directly by the people, and any law to deprive the people of their right to elect their county superintendents in the counties now having this privilege would meet with strong opposition. If a law were enacted for the election of all the county superintendents by the people of their respective counties it would have several advantages over the present method. In the first place it would secure a uniformity which is very much needed and which can scarcely be brought about in any other way; and secondly, it would make the people more directly responsible for the success or failure of the schools, and thus make them to become better acquainted with and to take a greater interest in them. As all the county officers are elected for four years, the county superintendent should be elected for the same length of time.

He also urges upon the Legislature the propriety of paying the county superintendents better salaries. “No other officers, save perhaps township superintendents, are so poorly paid. Their duties are onerous, responsible, and often harassing, and their faithful performance of the greatest importance to the success of our public schools. I believe it would advance the school interest of the State to pay them salaries sufficient to enable them to devote all their time to the duties of their offices, and to require them to visit every public school in their counties at least once during its session. The Legislature enacted a special law for Jefferson requiring this, and providing that the county

superintendent should be paid \$65 per month, over and above the regular compensation of county superintendents, out of the county treasury, and I am informed that the people of the county are well pleased with the law."

APPEALS FROM DECISIONS OF TOWNSHIP SUPERINTENDENTS OR TRUSTEES.

Under the present laws appeals from the decisions of township superintendents and trustees are restricted to the transactions of the meeting of parents and guardians the last week in October, and an appeal can then be taken to the county superintendent only. The right of appeal is liable to abuse and should not be enlarged too much, but at the same time every provision should be made against the liability of an injustice being done. Hence it is advised that appeals from decisions be not limited to any particular meetings, and that appeals may be taken from the county superintendent to the educational board of the county.

SALARIES OF TEACHERS.

Under the present regulations there is no great inducement to teachers to make efforts for first-grade certificates, as the holder of a third-grade certificate may be paid as much as one who holds a certificate of the first grade. The superintendent recommends that a law be passed making salaries of third-grade teachers from ten to twenty dollars per month; those of second-grade teachers from twenty to thirty-five dollars per month; and that teachers of the first grade shall not be paid less than thirty-five dollars per month, if there are sufficient funds for a three months' session at that rate, nor more than fifty dollars unless there are sufficient funds to run the schools six months or more at that rate, or where the patrons supplement the salary of the teacher.

RENT OF SCHOOL LANDS.

In many townships of the State the sixteenth sections of school lands have never been sold, but are leased as provided by law, and the money received from them is reported to the county superintendent, but the law requires no report of it to be made to the State superintendent, so that it might be deducted from the apportionment to such townships. A law should be passed requiring the county superintendents to notify the State superintendent of all money received as rent from school lands.

TEACHERS' EXAMINATIONS.

The law prescribes upon what branches and by whom teachers shall be examined, and that correct answers shall be given to 70 per cent. of the questions in order to obtain a license. The questions are prepared by the boards of examiners in the different counties, and there is a great difference in the character of the questions asked. In some counties questions are asked candidates for third-grade certificates that only the most thorough scholars could answer, while in other counties only the simplest questions are given candidates for certificates of the first grade. Frequently "catch questions" are given, or such as require a retentive memory only. The superintendent thinks that it should be the duty of the State superintendent, assisted by two experienced teachers, to prepare different series of questions to besent out together with rules for conducting the examinations, to the different boards of examiners. This plan has been adopted in many of the States and gives very general satisfaction.

RECOMMENDATIONS.

Superintendent Palmer recommends: That an appropriation for the benefit of the public schools of not less than \$100,000 be made in addition to the regular annual appropriation.

That the State constitution be so amended as to authorize and require the levy and collection of a tax not exceeding five mills on the dollar, in counties, cities, towns, townships, or other school districts, to be used for building and furnishing school-houses, or for other school purposes.

That all county superintendents be elected by the people, that their salaries be increased from \$75 to \$150 per annum, and that they be required to visit every school in their respective counties, for which they shall receive compensation out of the county treasuries.

That provision be made by law for securing a complete enumeration of all persons within the school age.

That the pay of teachers be graded according to their certificates.

That the scholarship required for a third-grade license embrace such a fair knowledge of English grammar as will enable the applicant to speak and write the language with reasonable correctness, and that all applicants for a teacher's license be required to pay 50 cents before being examined.

That the poll-taxes collected each year from each race be made the basis for teachers' contracts and payments the succeeding year.

That the right of appeal from decisions of township superintendents and trustees be extended.

That county superintendents be required to report to the State superintendent as to the renting of school lands.

That probate judges be required to report abstracts of the assessments of poll-tax to the auditor instead of to the State department of education, and that by the last day of July, or as soon as settlements are had with the collectors, the auditor shall certify to the department of education the amount of poll-taxes paid into the State treasury to the credit of the school fund of each county and school district receiving its school fund direct from the State treasury.

"That county superintendents be required to send to this department but one payroll, retaining a duplicate, which, together with the original, when returned with the funds for payment of teachers each quarter, shall be signed by the teachers and retained by the county superintendent and filed in his office.

"That tax collectors, at the end of each month in which they collect any poll-tax, shall make report of the same in duplicate, sending one report to this department and the other to the county superintendent. That the collector shall first deduct the commissions allowed by law to the assessor and himself from the amount of poll-tax collected for each race in each township and school district, and report only the net amount paid into the treasury to the credit of the school fund for each race in each township and school district."

ARIZONA.

The Legislature of Arizona failed to make any provision for the printing of the report of the superintendent of public instruction. For whatever information relating to education in Arizona is contained in this Report consult the Index.

ARKANSAS.

[From Report for 1886-87 and 1887-88 of State Superintendent Woodville E. Thompson.]

GENERAL STATEMENTS.

That the schools of Arkansas have made great advances in the last few years is acknowledged by all. This has been caused by the interest manifested by the people in the schools and their efforts to place them in a better condition, and by the faithful work of an earnest corps of teachers. The superintendent says "that no State in the Union is doing more for public schools in proportion to its taxable property than is Arkansas"—a statement which many may be disposed to accept *cum grano salis*, but which he says will be found correct upon investigation. The taxes for school purposes are cheerfully paid by the people. During the last few years many valuable school-houses have been built, and now it is probable every county in the State has one or two school-houses which cost from three to five thousand dollars. No distinction is made in the schools between the children of different classes, but the children of senators, representatives, and day laborers meet in the same room and are treated in the same manner.

There is still room for improvement, however, especially in the country schools, where three-fourths of the children are educated. The term of the schools should be longer, and means should be provided for a better equipment of the schools.

GROWTH OF THE SCHOOL SYSTEM.

In 1827 Congress gave the Territory of Arkansas seventy-two sections of land for the purpose of establishing a seminary of learning, but afterwards this grant was modified so as to allow the lands to be used for the benefit of the common schools. In 1836 an additional grant of the sixteenth section of every township, and seventy-two sections, known as saline lands, was made for the benefit of the common schools. From the admission of Arkansas as a State, in 1836, excellent constitutional and legislative provisions were made for the common schools, and there was a large revenue from the sales of school lands, but we find no evidences of the progress of the schools, and very probably little was accomplished.

The Legislature of 1866-67, composed of the best and most intelligent men of the State, passed an act providing for school revenues and for the proper administration of the system, under a State superintendent and county commissioners, and for the examination and licensing of teachers. From this time the schools began to make some improvement, which was steadily kept up, except during the two years from July, 1873, to 1875. From 1875 the expenditures for school purposes have gradually increased until, in 1888, we find the amount nearly one million dollars.

COUNTY SUPERVISION.

Superintendent Thompson again calls the attention of the Legislature to the importance of having a county superintendent for the public schools. No private corporation having so many persons engaged in its work and such interests involved would neglect to provide some one fully acquainted with the work by experience to see that it was properly and faithfully performed. The State is spending many thousands of dollars every year upon the public schools, and these schools are determining to a large extent what shall be the intellectual development and moral qualifications of its future citizens. When these considerations are taken into account, the necessity of competent and faithful supervision is so patent that all must acknowledge it.

SCHOOL DISTRICTS.

In the reports of the State superintendent for the years 1884 and 1886, attention was called to the advantages to be derived from abolishing the school districts and instituting township districts. Superintendent Thompson thinks that it is absolutely necessary to the proper administration of the schools that the change be made. There are at present four thousand two hundred and eight school districts, and more than twelve thousand directors, many of whom are not competent to discharge their duties, and others often neglect them. If the directors were chosen from the entire township much better officers could be selected, and there would be less probability of designing men getting control of the school affairs in order to defeat a school tax, or to give a teacher's place to some dependent relative, as is too frequently the case at present.

It sometimes occurs that in one of two school districts adjoining each other the school term will be eight or nine months, there will be an excellent teacher and a comfortable school-house; while in the other the opposite conditions prevail, the school term possibly being two or three months. Under the township system such differences would not occur; there would be no trouble in transferring a pupil from one school to another, the number of patrons attending each annual meeting would be much larger, and the interest correspondingly greater. The testimony is given of quite a number of superintendents of States where the system has been partially or entirely adopted, showing its advantages and a general desire on the part of school officers to abolish the district plan.

TEXT-BOOKS.

How to secure uniformity of text-books at the least expense is a question which has been very generally considered, and the superintendent of education of Arkansas thinks that the Legislature should take some action to secure this end. The plan suggested is State and county adoption, or else the furnishing of books by the school district.

REVENUE.

The amount of funds received for school purposes in 1887-88 was sufficient to secure an average school term throughout the State of only four months, and hence the possibility of longer terms without increased taxation deserves careful consideration. In 1874 and 1879 there were destroyed by mistake large amounts of interest-bearing State scrip, which with the accumulated interest up to the present time would exceed \$300,000, all of which can easily be replaced by the State, and the permanent school fund would thus be increased to more than \$500,000. Besides, the Legislature in 1875 passed an act granting to the school fund ten per cent. of the net proceeds of all sales of public school lands, but the schools have received nothing whatever from this source.

If the addition from these sources could be made to the school funds, there would be a sufficient amount to maintain the schools for a month longer than at present.

RECOMMENDATIONS.

The following changes in the school law are recommended by the State superintendent: That the State apportionment shall be made by the second Monday in September of each year, and that the auditor be required to report on the first Monday the amount for apportionment in the State treasury on the 1st of September.

That the county examiners and district directors be required to make their reports by July instead of September.

That the State board of education instead of the State superintendent be authorized to examine applicants for State licenses, and that each applicant be required to pay a fee of \$10 which shall be used in paying the examining committees.

That the returns of the annual district elections be made within ten days after said elections.

That the directors be required to select text-books from the list recommended by the State board or by the State superintendent.

That the county treasurer shall receive two per cent. commission on all money paid out by him on warrants drawn by school directors.

That certificates of election shall be given to those persons elected district directors within five days after the election.

CALIFORNIA.

[From Report for 1886-87 and 1887-88 of State Superintendent Ira G. Hottel.]

GENERAL STATEMENTS.

It is thought that at no time have the people received more and better work for their money expended upon schools than in the last two years. The teachers have been well qualified for their business and have taken great interest in it, and the county superintendents have made every exertion to put the schools in a condition of the greatest usefulness. Two hundred and five schools report that they have not sufficient school grounds, while a large number of others report that their houses are badly ventilated and that they are not supplied with good furniture and other apparatus.

The latest census returns show the population five to seventeen years of age to be 270,500, which is apparently a decrease from the number of the previous year. This is occasioned by a discrepancy in the returns from San Francisco for the two years. None but strictly honest and faithful men should be selected as school census marshals, and they should not be selected as a reward for party service; and a law should be passed forbidding that they be paid at so much per capita of the children listed, as this offers a great temptation for false returns.

The State superintendent recommends that kindergartens and county high schools be made a part of the public school system of the State, and thinks that the establishment of manual training schools will be of great benefit to the State.

PRIVATE SCHOOLS.

The number of children five to seventeen who attended private schools during the year 1887-88 was 20,768, or 7.68 per cent., which is about the same proportion as for several years past. The principals of all private schools should be required to report both to the census marshal and to the State superintendent, so that the exact number of children in the State attending school may be known.

NON-ATTENDANCE.

The number of census children not attending any school during the year was 61,345, which is apparently a very large number of children growing up in ignorance; but it should be remembered that a large part of these are children under seven years of age who will probably attend afterwards, while many others are temporarily withdrawn from school for various reasons and will attend again. Still, the number is larger than it should be, and every school district should be required to furnish accommodations for every child desiring admission, or else forfeit its part of the State school money; and then the compulsory school law should be strictly enforced.

TEACHERS.

There are now 1,112 teachers in the State holding life diplomas. In the matter of teachers' compensation California stands among the very first States of the Union; and she allows the same compensation for like work, whether done by men or women. No person should be employed as a teacher who is not possessed of a strong and healthy physical constitution by which he is enabled to throw life and animation into the work of the school-room, and to endure the nervous strain consequent upon teaching.

COUNTY SUPERINTENDENTS.

Only the very best men should be chosen as county superintendents; progressive, earnest, and practical educators; and when such have been chosen, they should be paid a reasonable salary. The salaries of county superintendents now range everywhere from \$100 to \$4,000, showing that while some are paid well others receive mere pittance. Each county superintendent should be required to send in a brief report of the condition and progress of each school in his county, such reports to be of the same size that they might be bound together.

TEXT-BOOKS.

A constitutional amendment was adopted in 1884 for the compiling, printing, and publishing of a series of text-books for the common schools of the State, which books should be sold at cost and should not be changed for four years. The Legislature of 1885 appropriated \$20,000 for compiling the books, and \$150,000 for the necessary plant, ma-

terials, and labor. The books to be printed were: Three readers, one speller, one arithmetic, one history of the United States, and one geography. The following persons were entitled to make orders for books: County superintendents of schools, principals of State normal schools, secretaries and clerks of school districts, and retail dealers.

The present State superintendent states that when he came into office "no adequate means had been provided for the distribution of the text-books, and no provision whatever had been made for producing additional books after the first appropriation should become exhausted, the first editions of the books sold, and the money paid into the State treasury."

In 1887 an amendatory and supplementary act was passed making provision for the following text-books, in addition to those previously mentioned: One elementary arithmetic; one elementary grammar, or language lessons; one elementary geography; one physiology and hygiene, including a system of gymnastic exercises, and special instruction as to the nature and effects of alcoholic drinks and narcotics. One hundred and sixty-five thousand dollars, together with the unexpended balance of the former act, were appropriated to cover the expense of printing the books, and \$15,000 for compilation.

"The poor binding of the first edition of the readers and speller has been the principal cause of complaint concerning the books. Fortunately, however, the first editions of these books were not large, and the superintendent of State printing was requested to notify the then foreman of the bindery that no more inferior work would be accepted or passed by the board of education. No complaints have been made concerning the binding of subsequent editions, and we doubt if any publishing house can be found which turns out better presswork and better binding on text-books than that which is now done at the State printing office at Sacramento, under the superintendence of Mr. J. D. Young."

The following shows the cost of the books:

Prices of books now issued and ready for use, June 14, 1888.

Name of book.	Cost Price at Sacramento.	Cost by Mail.	Price to Pu- pil from Re- tail Dealers.
	Cents.	Cents.	Cents.
First Reader.....	15	20	20
Second Reader	33	41	40
Third Reader.....	54	66	65
Speller.....	25	31	30
Primary Number Lessons.....	20	25	25
Advanced Arithmetic	42	50	50
English Grammar.....	42	50	50
United States History.....	70	82	80

One of the important results of publication by the State is that uniformity of text-books is secured throughout the State. The State superintendent says:

"Having been one of the earliest advocates of a State series of text-books, it has not only been my duty but my purpose and pleasure to aid in giving the scheme a fair trial, and bringing the experiment to a successful issue. Since some of the books have been issued and gone into use I find many persons who, being opposed to the undertaking at first, have now become convinced of its feasibility and economy. Some of the books have been pronounced the best of their kind, and I am of the opinion, judging from my observations in various schools which I have visited, and from the expressions of superintendents and teachers at institutes, that the experiment thus far has fully met the expectations of its most ardent friends, and that the books themselves are giving a good degree of satisfaction.

"If the books are as good as others, or will answer the purpose as well, then the question which most concerns the parents is, Which will cost the least? It may be claimed, and must be admitted, that it costs the State more to manufacture the books than it would cost a private publishing house. The State pays better wages than the private publisher, and works its help eight hours a day, while the private publisher works his help ten hours a day. But the consumer is interested not in the actual first cost of the books, but in the cost to him.

"Since the State charges no manufacturers' profit, no jobbers' profit, and 'the retail dealer is allowed by law to charge no more than it would cost the pupil to have the books sent to him by mail (the retail dealer making only the difference between postage and freight), it follows that the consumer, or pupil, pays the private publisher, or his retail dealer, from thirty to sixty-six per cent. more than he is required to pay the State for his text-books."

COLORADO AND CONNECTICUT.

The School Reports of Colorado and Connecticut were not received in season to be considered in this part of the Report, but abstracts of them may be found at the close. See Index.

DAKOTA.

[From Report for 1886-87 and 1887-88 of the Territorial Board of Education of Dakota.]

GENERAL STATEMENTS.

The progress made in the educational affairs of Dakota, as shown by the statistical summary of the last five years, given in the report of the Territorial Board of Education, has been very rapid. This progress has been made by all grades of the schools, from the ordinary ungraded schools to the colleges and universities; and it has been a general progress, an increase in attendance and in amount of expenditures, a better quality of work, and longer school terms. School officers and teachers have worked harmoniously together to place the schools on a higher plane of usefulness, and we now find the outlook for the future most promising.

Less than one-fourth of the county superintendents made their reports within the time required by law, the difficulty being caused by a failure of township and district clerks to forward their reports promptly, and in many cases then they were inaccurate. If a Territorial fund were raised to be distributed among the districts when full and accurate reports had been made from them, it would soon remedy the evil. It would also be of much assistance to poor and unimproved districts. The annual salary of the district clerk should not be paid until he presented a receipt for his prompt report from the county superintendent.

Instead of a report being made by the board of education only every two years, it should be made annually, so that the matter contained in it might be fresh and of greater interest.

FINANCIAL CONDITION OF THE SCHOOLS.

The finances of the schools are generally well managed, and in this respect the schools are in a very prosperous condition. The amount of warrants outstanding is not large, and generally sell for almost their full value, while the bonds always sell for their face value and frequently above par. The warrants draw interest at eight per cent., and the bonds at from seven to eight per cent. The board of education has endeavored to get the schools to operate on a cash basis, and has discouraged the issuing of bonds, so that fewer bonds were issued during the last year than for many years previously. The interest on those issued is usually paid promptly, but in some cases it was neglected and caused complaint. On account of recent changes in the school law some uncertainty exists as to who is authorized to issue the bonds, and unless some action is taken on the matter by the Legislature the bonds will not command as good prices as they should.

DISCREPANCIES.

An examination of the reports of county superintendents for the last five years shows quite a discrepancy in the amount of money on hand the last day of the school year and the first day of the next year, although the amount should be the same; in most cases, too, the amount of money on hand is less than that reported as left over. The balance on hand June 30, 1884, was reported as \$296,000, but the amount on hand July 1, 1884, the next day, was \$262,000, showing a loss of \$34,000. The next year there was a loss of \$218,000, and the next year a loss of \$145,000, but on July 1, 1887, there was a gain of \$27,000. It is thought that these discrepancies are mostly due to carelessness and imperfect book-keeping, but it is quite probable that among the two thousand officers there are some dishonest ones.

As the amount of public money paid out for school purposes is larger than that for any other purposes, it should be required that a perfectly accurate account of it be kept. At present the township and district treasurers receive the money from the county treasurers and pay it out on the order of the clerk and chairman of the school board; but it would be better if it were the duty of the county treasurer himself to disburse all the school funds of the county, as that officer is usually a good financier and is placed under bond to discharge his duties faithfully.

SCHOOL LANDS.

The subject of school lands is one of the most important connected with the schools of Dakota. The number of acres is about two millions, with an estimated value of about ten millions of dollars, and as the time is drawing near when Dakota shall become a

State and the title to the lands shall be transferred from the National Government, the question of the management of the school lands becomes one of great importance; especially so when the history of school lands in other States is considered, for it is generally found to be a history of "extravagance, waste, fraud, and disappointment to the friends of education."

In many parts of the Territory settlements have been made on the school lands, and in others much valuable timber has been removed from them, and, unless some steps are soon taken to check these trespasses, so great will be the number of depredators that they will be able to influence legislation in their favor, and the public schools will be thus robbed of their resources.

If the school lands are sold and the funds invested for the benefit of the schools, the principal can never increase while the interest must gradually decrease; but if the lands are held by the State and leased out on long terms, the value of the lands would greatly increase and the school funds be thus augmented, and in no case could the loss exceed one year's income. This plan is strongly recommended by General W. H. H. Beadle, ex-Territorial superintendent of public instruction, who is better acquainted with the subject than any one else in the Territory, and it is fully endorsed by the board of education. In connection with these lands it should always be remembered that they were granted by the General Government for the benefit of the common schools; special grants having been made for universities, normal schools, and the agricultural college; that the lands granted to many of the other States have been sold and the money wasted, and it therefore becomes the people of Dakota to guard theirs with jealous care lest another dark chapter be written in the history of public-school lands.

SCHOOL-HOUSES.

There are four thousand one hundred and two school-houses in the Territory, with an estimated average value of about eight hundred dollars; the number of children of school age to each house, according to the latest estimates of the population, is twenty-eight. In school accommodations for its children, therefore, Dakota ranks with the first States in the country. Many of the houses, though, are not built with as much regard to the comfort and convenience of the pupils as the extreme cold and severity of the winter storms require. All of them should be built with a fuel pit or cellar beneath them so that it would not be necessary to leave them in severe weather to secure fuel.

The last Legislature authorized the department of education to "adopt the best plans and specifications for the construction of school-houses, and to furnish the same to the various school boards of the Territory, when needed, free of charge." Quite a number of urgent requests for plans were received, but as the Legislature made no appropriation to secure them, nothing could be done by the department. A small appropriation should be made for this purpose, and a saving of money in the construction of houses will result, as well as the insuring of better light, heating, ventilation, and sanitary condition.

EQUIPMENT OF SCHOOLS.

Sixty-one schools are without blackboards, and 1,034 without an unabridged dictionary. Two hundred and seventeen have school libraries containing 4,937 volumes. Local school officers have been encouraged to avail themselves of the provisions of the law regarding libraries, as it is thought that they will prove of great value to the children.

UNIFORMITY OF SCHOOL SYSTEM.

Seventy-six counties of the Territory have the township system, and fifteen the district system. The two plans have thus been in direct contact, and with the exception of the fact that the district brings the people into close relations with the schools, all the arguments are in favor of township districts. In the counties operating under the district system the law has been so obscured by enactments, repeals, and reenactments that it is difficult to determine what the law is, and many disputes have been occasioned. It is very desirable that the Legislature place these fifteen counties under the township plan like the other seventy-six counties.

SCHOOL TERM.

The average length of a school term in 1887-88 was one hundred and six days, three less than in the previous year, the decrease being caused by a failure of crops in a few of the counties. The highest average in any county was one hundred and forty-three days, the lowest was sixty-three days; but one hundred and fifty districts had no school at all. The law does not require the schools to be open any specified length of time, and in some of the districts the officers would not levy a sufficient tax to provide schools. It should be required that every district maintain a school for at least five months, and in case of failure that the county superintendent be empowered to do so.

COMPULSORY EDUCATION.

In 1886-87 the per cent. of children attending school was 83, but in 1887-88 only 81; hence it would seem that the compulsory law was a dead letter; yet there have been instances where the law has had effect, though it should have had much greater effect. An education is not intended simply for the benefit of the child and parent, but for the welfare of the State also, and so when public schools have been established by the State it has the right to require that all the children shall be educated.

TEACHERS.

The number of certificates of the first grade issued during the year 1887-88 was 246, of the second grade 1,442, of the third grade 2,153, and the number of applications rejected was 493. While the ratio of male teachers to female has been about the same for several years, the salaries of males have been gradually diminishing to that of the female teachers, showing that the latter are quite likely to prove themselves competent for the work. The standard of teachers has been raised very much, especially by the law of 1887, but it is thought desirable to maintain this standard for a time at least, and that sufficiently high wages be paid to get good teachers. On account of the low wages and shortness of the term, most of the teachers are required to seek other employment during the rest of the year.

STUDIES.

Of the 93,826 pupils enrolled only forty thousand have been studying physiology and hygiene. The law requiring this instruction has met with very little opposition, and it is probable that it will soon be very generally complied with.

Strong efforts have been made to introduce drawing into all the schools, and much attention has been given to it at meetings of teachers. There is a great tendency to crowd too many things into the school course, but it is thought that this branch can be made to occupy the attention of the pupils during leisure moments and be of much benefit to them.

According to the requirements of the law, the board of education, after getting all the information possible on the subject, prepared a regular course of study for common schools, including the high and normal schools, and forwarded copies of it to all the teachers and school officers. In the normal schools it proves quite satisfactory, and when it shall have been longer in the common schools it will probably prove very advantageous, especially in economizing time and force.

COUNTY SUPERINTENDENTS.

The influence upon the schools of a thoroughly qualified county superintendent is very great, and he can assist very much in making them a success. He should be the leading educator of the county, and in all cases should be required to hold a first-grade teacher's certificate, as it would be absurd to have a superintendent whose duty it was to examine teachers, but who could not pass the examination himself. Most of the superintendents in Dakota are men prepared especially for teaching, but in some cases incompetent ones are chosen, and the board of education should have the power to remove such. The term of office of county superintendents should be made longer. "A good man is barely able to get his work organized till he is called upon to give it up or seek a new election. He should be allowed a larger salary by law, and relieved in a measure from the restraints frequently placed upon him by the county commissioners. He has an important work to do and he should be given the opportunities to perform his duty well, and receive a just compensation for it. When township school boards fail to provide the duration of school required by law, he should have authority to step in and provide it. In many ways his authority in school matters should be extended and his position backed up. He is the most important officer in the whole educational machine, and though laws may to some extent destroy his usefulness so long as he exists at all they can not destroy his influence. In all that looks to real advancement in education he must be the leader, no matter what the work or influence of other officers. Every possible safeguard should be thrown around his election, and he should be removed as far as possible from partisan politics."

TEXT-BOOKS.

While nearly all the States and Territories have laws regulating the use of text-books in the schools, the Legislature of Dakota has done nothing at all with reference to it. It would prove highly advantageous if it were required that a uniform series of text-books be used throughout the entire Territory, and the Legislature should pass a law requiring uniformity in the townships at least, and that when a series has been adopted it should not be changed in less than five years; and when this has been enacted the different township officers can hold a convention and adopt a common system, and thus secure uniformity throughout each county.

FOREIGN LANGUAGES.

The law requires that the common schools shall be taught in the English language; but some instances came to the attention of the board of education where the teacher was not even able to speak the English language, and nothing could be done about it, as the foreign element was so strong that they not only controlled the schools but the election of county superintendent also, and a strong public sentiment was created in support of the schools taught in a foreign language. The board of education recommends that it be authorized to remove any county superintendent who refuses to enforce the law on this subject.

RECOMMENDATIONS.

The following recommendations are made to the Territorial Legislature:

That the fifteen counties now operating under the district system be placed under the township system.

That the county treasurer be made *ex-officio* treasurer of the several school townships of his county.

That a general board of control be established to have charge of the various public educational institutions for higher and special instruction.

That the law relating to the issuing of bonds by school townships be so amended as to authorize the clerk and chairman of the school board to execute the bonds instead of the clerk and director, no such officer as director having been established.

That a law be passed to prevent trespasses upon the school lands.

That a general territorial tax be levied for the support of schools, to be distributed to the several counties in proportion to the school enrolment.

That the clerk of the township school board be required to hold a receipt from the county superintendent that his annual report has been correctly made and delivered before he shall be allowed the last half of his salary.

That an appropriation be made to secure plans and specifications for school-houses, and that it be required that school-houses be built according to them.

That a uniform law be passed regulating the out-houses of the rural schools.

That each school district be required to maintain a school for at least four months each year.

That first-grade teachers' certificates be valid for three years and entitle the holders to teach in any county in the Territory.

That the board of education be authorized to enforce the course of study prescribed by law.

That each director of the subdistricts be allowed two dollars for each quarterly meeting he attends.

That the appropriation of \$50 per county for institute purposes be changed to an appropriation of \$4,800 per year for the employment of four institute conductors for the Territory, and that an additional appropriation be made to cover their expenses.

That a normal school for North Dakota be established.

That the law relating to the powers of the subdistrict directors be so amended as to leave the entire control of the schools and the employment of a teacher to a township school board.

That it be made a misdemeanor for a clerk and chairman to execute any contract unless previously ordered so to do at a regular meeting of the board, or at a special meeting called according to law. Directors should be prohibited from signing any contract or agreement for furniture or fixtures at any time.

That the county superintendent be elected for four years; that residence in the county not to be required, but that a minimum standard of qualifications be established, and that he be subject to removal by the Territorial board of education.

[From the Report of the State Board of Education to the Governor, 1888.]

"The progress of education during the year ending June 30, 1888, has been very satisfactory; indeed, it is not too much to say that it has been gratifying beyond anything that we had expected. It is safe to affirm that during no year of our entire educational history has so great an advance been made in all that pertains to the real work of education, no matter in what line considered. Although the reports from local officers to this department are not all in, enough is known to bear us out in saying that the number of school-houses built, the amount of money raised in the Territory for school purposes, and the number of children of school age in the Territory show a healthy and vigorous growth. But the results of the year's activity is not shown in statistics altogether, but rather in an awakened interest in all that pertains to education, in a more cordial public support given our educational workers, in larger enthusiasm in the teaching force, in an increasing number of pupils in the higher and special schools, and lastly,

though not least, in the convergence of all lines of educational work toward one general system of schools for the Territory. Our people are looking more to the kind of training their pupils are receiving. Our teachers are becoming more professional, and are putting forth much greater efforts to prepare themselves for efficient service, as is attested by a greatly enlarged attendance upon the teachers' institutes, associations, and normal schools. The people generally take a lively interest in school affairs, and are proud of our educational progress and standing, and are each year making greater efforts and sacrifices in behalf of our school system. There is no demand made upon them that is so readily and generously supplied as the demand for funds for school purposes. We have reasons to be satisfied with the present and hopeful for the future."

CITY GRADED AND HIGH SCHOOLS.

"Great progress is being made by the principal cities in the Territory in matters pertaining to education. Fine and substantial buildings are being erected, and all the apparatus and appliances are being provided that are necessary for thorough school work. Skillful and experienced teachers are being sought in the educational centers of the East, and modern methods are adopted in all of the schools. Good salaries are usually paid, and tenure of office of both principals and teachers is becoming more permanent."

SCHOOL LANDS.

"No subject incident to the school affairs of Dakota is of greater interest and importance to her people than the subject of school lands. Hon. P. F. McClure, commissioner of immigration of the Territory, estimates the number of acres of school lands at three millions, and the estimate is a low one. At the very moderate valuation of six dollars per acre these lands represent a magnificent school fund of eighteen million dollars. If this sum were at the present time paying five per cent., the annual income from this source would be nearly sufficient to cover half the total expenditures for school purposes in Dakota. In their present condition the schools are deriving no benefit from them. Although the lands of the Territory generally are rapidly increasing in value, in many places the school lands are depreciating in value. Unoccupied lands in the eastern part of the Territory are becoming very scarce and the pressure of settlers is very great, so that much of the school land is occupied and cultivated. It is not a rash estimate that puts the portion of the school lands now cultivated at one-fourth of the whole. Each crop taken from them is impoverishing the land and diminishing its value, for the cultivator is anxious to get all he can from it without making any return to the land and with the least possible care of it. Many sections through this neglect are growing up to noxious weeds and will soon be in a condition that will make them valueless to any one. We would earnestly urge the Department of the Interior to take such steps as may be deemed wise to prevent further despoliation of these lands, that the people of this Territory, in whose behalf they have been set aside, may receive them undiminished in value. We would most respectfully advise that Congress take action authorizing their rental for the benefit of the schools of the Territory. In many parts of the Territory the lands would readily rent at the rate of from fifty cents to one dollar per acre for grain-raising purposes, while the unbroken sections would be easily disposed of at a fair rent for hay and pasture, and the value to the new State remain undiminished. We believe that such a disposal of them would meet the universal approval of our people. In a new country like this the demands upon the people that must be met by way of taxation are very numerous and burdensome. In some counties the rate of levy for school purposes alone is 27 mills, a tax that would not be levied or borne in many of the older and more wealthy States. Many of the people have come here to make homes, and have brought little capital with them besides their courage and energy, and the burdens of taxation are very grievous. A small income now from the school lands will be far more helpful to them than four times the amount ten years hence. We would, therefore, respectfully urge that immediate steps be taken to prevent further waste of the school lands and to give the people of the Territory some present benefit from them."

DELAWARE.

[From Report for 1883 of A. N. Raub, President of the State Board of Education.]

GENERAL STATEMENTS.

The president of the State board of education thinks that it was the intention of the framers of the law of 1887 that a biennial report should be made by the State board of education on the first Tuesday of December, 1888, instead of in 1889; and he has acted upon this presumption.

Great difficulty has been experienced in collecting full and accurate statistics under

the new law, as its requirements are so meagre and the incorporated boards are under no obligation to furnish statistics to the county superintendents.

It is not deemed advisable to recommend the adoption of a law for compulsory school attendance, as it would probably prove inoperative and unpopular.

COUNTY SUPERINTENDENCY.

The law establishing county superintendency proves to be a very wise one; the superintendents appointed by the Governor have discharged their duties faithfully and conscientiously. The schools have been regularly visited by them, and the examinations carefully conducted; they have held annual county institutes in which thoroughly qualified instructors were employed, and from which the teachers doubtless received great benefit.

The term of office of the county superintendent should be at least two years, and it would be better if it were four years; and the superintendent should be required to possess special qualifications and experience in teaching.

TEACHERS' CERTIFICATES.

According to the present regulations, a candidate who answers sixty per cent. of the questions given at a teachers' examination is entitled to a third-grade certificate which is valid for one year; but to obtain a second-grade certificate, which is only valid for two years, it is necessary to answer ninety per cent. of the questions. In most of the States the ability required to obtain this second-grade certificate would entitle to a certificate practically good for life. Correct answers to eighty per cent. of the questions should entitle to a second-grade certificate.

The law as to first-grade certificates is somewhat indefinite; but it requires that the applicant shall be qualified in certain specified branches, and the certificate is valid only for three years, presumably in the county for which it was issued. It should be valid throughout the State, and should be renewable every three years by the county superintendent.

Certificates valid for life should also be issued to those who had held first-grade certificates and had taught successfully for a certain number of years, as this would prove an incentive to teachers to make teaching their life-work, and would elevate the profession.

It is thought, too, that the life certificates of other States should be recognized in Delaware if a like courtesy were shown in other States to the holders of life certificates issued by Delaware.

THE HUNDRED SYSTEM.

The efficiency of the schools would be very much increased by abolishing the school districts and making the hundreds, as at present constituted, the school units; thus adopting what is called in the western States the township system. Or a modification of this system might be adopted by dividing the hundreds into incorporated boroughs and rural districts.

One advantage arising from this system would be that a high school might be established in each hundred.

TEMPERANCE INSTRUCTION.

The law requiring instruction in temperance and hygiene is faithfully observed, but it cannot be expected that a law so loosely worded can effect much in a short time, as the instruction may be given only once a week or even once a month.

FREE TEXT-BOOKS.

A law should be enacted permitting each district to furnish free text-books to its pupils, as it gives eminent satisfaction wherever it has been tried, and when once adopted is never abandoned. It would secure books at less cost, and increase the attendance of pupils, as indigent pupils would not be kept at home on account of the expense of furnishing them with books; it would secure a better classification of pupils, and obliterate class distinctions.

INCORPORATED SCHOOL BOARDS.

According to the present laws, schools having incorporated school boards have no supervision except that given by the commissioners, and their teachers are exempt from examination. It would be better if all the schools of a county, except those under special superintendents, were placed under the county superintendent.

NORMAL TRAINING.

Delaware, like most of the other States and of the Territories, should have an institution for the special training of teachers, and a diploma from it should entitle the holder,

after some years of successful experience, to teach without further examination. "Teaching will in time be recognized as a profession if teachers be trained in their work, and we ought to do for the Delaware teachers what other States are doing for theirs. Many of our brightest young men and women drift to the State Normal Schools of other States for their training, thus expending thousands of dollars abroad that ought to be made to contribute to the prosperity of our own State. But a possibly worse feature is the fact that most of these teachers remain in other States after receiving their training, and teach where their diplomas are recognized as valid without further examination. Our State thus loses many good teachers whose services are needed at home."

RECOMMENDATIONS.

Provision should be made for taking a census of the school population at least every two years. At present it is impossible to ascertain what per cent. of the children of school age are attending school.

An "Arbor Day" should be established. The Governor should be authorized and requested to appoint a day, not later than the first of March in each year, to be spent by the pupils and their friends in adorning the school grounds and their homes by the planting of trees and shrubbery.

The members of the State board of education receive no salary for their services, but they should at least receive sufficient compensation to cover the necessary expenses of stationery, travelling, etc.

DISTRICT OF COLUMBIA.

[*Report of Board of Trustees for 1887-88.*]

The committee of the board of trustees state that a very hopeful advance was made by the schools of the District during the year 1887-88; that the appropriations made by Congress during the two preceding years had done much to overcome the great need of the public schools, increased accommodations for the pupils; but still the two most urgent wants of the schools, in order to secure their complete success, are increased accommodations for the pupils of the high schools and more liberal salaries to the teachers.

ATTENDANCE.

The total enrolment of pupils in the public schools during the year was 34,850; the average enrolment 28,553; showing that the enrolment during each month of the year was, on an average, 6,297 less than the entire enrolment. The census taken by the police in June, 1888, showed the whole number of children of school age, six to seventeen years inclusive, to be 51,500; number enrolled in the public schools, 34,850; in private schools, 3,119; total enrolment, 37,969. The difference between the school population and the average enrolment in the schools was 20,389. This can be accounted for to a large extent. Many children that have been enrolled leave the city and thereby leave the schools; many of the older pupils leave the schools to enter upon some business of life; some leave because of sickness or death. But, after making due allowance for all these, a large number of absences are unaccounted for.

The question then arises, In what way can the public schools help to overcome this non-attendance? In the first place, ample provision should be made for pupils in comfortable, well-lighted, and well-ventilated buildings where they could receive full attention during the whole school day, instead of for two or three hours in the morning or afternoon.

In the second place, the school should furnish efficient and interesting work, suited to the capacities of all the children, and such as they see will be of help to them in their life-work.

It was noticed during the year that a large number of children within reach of the rural schools were not attending, and so the teachers made visits to their parents to induce them to send their children to school; and, as a result, the schools were soon filled with children who had been remaining at home simply on account of the indifference of parents or children. In a few cases, however, it was found that the non-attendance was occasioned by inability to buy books or proper clothing.

TRUANCY AGENT.

It is thought that if there were a truancy agent whose duty it would be, under the direction of the superintendent or other authority, to seek out the absent or tardy children, that the school attendance would be very much increased without the necessity of resorting to arbitrary compulsion. A truant law without a truancy agent would prove a failure.

VENTILATION.

Upon this subject Superintendent Powell says: "The school-rooms that have been provided during the last ten or more years are cheerful, thoroughly ventilated, and healthful. I am glad to be able to say the system of ventilation employed ventilates, and ventilates in spite of the preoccupation of the teacher or of the janitor. In respect of heating, lighting, and ventilation, nothing more is to be desired in the new buildings. Some of our older buildings, however, although fine, imposing structures, are poorly ventilated or are not ventilated at all. The more prominent of the former are the Franklin and the Jefferson; of the latter, the Wallach and the Cranch. Nothing, to my mind, should be urged more strongly, save only additional accommodations, than the improvement of the ventilating processes in the buildings named and in a few others. So easily may this be done, and at such a trifling expense comparatively, with the knowledge now possessed, that I should feel myself remiss did I fail to call your attention to this most urgent need and thus emphasize the suggestions of my co-laborers."

HIGH SCHOOLS.

The attention of the Commissioners of the District of Columbia is again most urgently called to the needs of the high schools, both of the colored and white children. The colored high school is situated in an extremely inconvenient locality for the greater portion of pupils attending it; it is poorly adapted to the purpose, and all the accommodation which it affords is urgently needed to meet the demands of the section of city in which it is located for schools of a lower grade.

The necessity for increased accommodations for the Washington High School was presented to the Commissioners in the last report, but as it was necessary to make additional provision for the primary schools also, the preference was given to the latter, and the high school was neglected; and, as was predicted by the trustees, a large number of children, entitled to admission by proficiency and deportment, made application, but on account of the limited accommodation three hundred and ninety-eight pupils, out of a total attendance of nine hundred and ninety-seven, could only receive instruction during one-half of each day. It is estimated that the total attendance during the current year will approximate twelve hundred pupils with accommodation for about seven hundred and fifty, and unless additional room is provided, it is probable that in another year all the pupils will be limited to half-day sessions. It is, of course, an injustice for some pupils to be limited to a half-day at school while others attend the full day's session. Full and effective work can not be done by either teacher or pupil where the instruction is limited to the short space of time devoted to recitations. In the high school, each teacher gives instruction in a particular branch to each class studying it, and when a class has recited to one teacher it goes to the room of another; hence it is necessary that all the teachers be in the same building.

It is worthy of special note that a much larger proportion of the boys and girls of this city continue their studies until they have entered the high school than is found to be the case in scarcely any other large city.

There are three courses of study in the high school: An academic course, a scientific course, and a business course; the first two requiring a period of three years, and the last a period of two years for completion of the prescribed work.

PHYSICAL TRAINING.

"The manual training now given to boys, together with their active and varied sports, afford much exercise for them. The industrial work for girls and their sports are less beneficial, afford less of vigorous exercise. Neither the industries nor the sports insure that systematic physical training or cultivation that is desired.

"Exercise is not cultivation. Exercise specifically directed and methodically taken results in cultivation.

"Calisthenic exercises are now employed by some of our teachers but not by all, and, I fear, not by many. The work done by these is apt to be spasmodic, and not being continued by the succeeding teacher of the school, is of little value comparatively."

"The good effects of the military drill given to the boys in the high school are apparent, whether the boys drill, march in military garb, walk across the school-room, or sit in recitation. These results are obtained by methodical exercises, each of which is had for a definite purpose. The lack of corresponding training is noticeable in the movements not only of girls in the high school but also below the high school, but the painful manifestation of the lack of physical cultivation is the absence of vigor and the presence of lassitude.

"The exercises of the school should be an alternation of mental and physical effort, both of which to be most profitable must be specifically directed and methodically done. If during the physical exercises the perfect ventilation of the room is assured, the school

would become a place to be sought and attended for health and physical cultivation, as well as for mental growth and improvement.

"I suggest the employment of two or more teachers of health exercises. These teachers would occupy the same relative positions that are held by the teachers of drawing or of music, and would do their work in a corresponding way. Pupils might by this means be trained systematically in manual exercises as well as in vocal exercises by the special teachers visiting the schools at stated intervals to give the instruction; the regular teacher repeating and supplementing the exercises for recreation and cultivation during the intervals of absence of the special teacher. Such exercises would help in the reading lessons, in the music lessons, in the drawing and writing lessons, and would give health and grace to all the children."

LIBRARIES AND APPARATUS.

It has been the constant aim of the teachers to reduce the didactic *memoriter* methods of instruction to the lowest, and to substitute examinations and investigations in the library and laboratory. For this purpose, there is need of suitable reference books and libraries containing historical, biographical, and scientific works, to which the teachers and pupils can have ready access; and there is need also of objects for investigation and illustration; so that pupils shall not always be required to examine books to obtain information. The demands upon the contingent fund for other purposes, as for instance the supplying of rented buildings with seats, have been so great that little help could be given from this source. In some instances money was obtained to supply these wants by giving concerts, by contributions, etc.; but it cannot be expected that much will be accomplished in this way.

SALARIES OF TEACHERS.

At present the prescribed average salary is \$670 per annum, and the board of trustees unanimously recommends that it be increased to \$685 per annum. The salary of messengers in the departments of the Government is \$840 per annum, and that of assistant messengers is \$720, in both cases the salaries being higher than that of the cultivated teachers of the District who were required to spend years in preparing for their work.

The proportion of children in the schools of high grade is much larger than in most other cities, and consequently more teachers of high attainments and experience are needed, and their salaries should be higher.

The appropriations of the last three years for school purposes have been accompanied with a restriction forbidding an increase in the number of teachers in any grade receiving \$900 or more. It is earnestly recommended that, if any restriction at all of this kind is needed, the limitation be \$1,200 instead of \$900.

The number of pupils in the eighth grade and in the high schools has greatly increased in the last few years, so that more teachers have become necessary for their instruction, but teachers of sufficient attainments to fill these places, and who have had experience, can obtain larger salaries; consequently several of the best teachers have resigned to accept situations elsewhere, and it has been found necessary to employ young college graduates who, in many cases, possessed fine ability, but who were entirely without experience.

MANUAL TRAINING.

"The school year was marked by the formal introduction of manual training into the curriculum of the public schools of the district.

"Every thing done in this branch of education was done with the purpose, ultimately, of adding the different parts thereof to the course of instruction and introducing them into their respective grades of school throughout the district. The appropriation for manual training, \$5,000 (for plant only), was such that this could be only partially accomplished the past year.

"That the value and practicability of the work might be tested it was engrafted in its entirety on the schools of a portion of the district. For instance, carpentry work, cooking, and sewing were introduced into all the schools of the third division in which it is proposed to teach these subjects respectively.

"A corresponding introduction of these studies was made in some schools of the second and fourth divisions and also in the high school."

"Throughout the district, at this writing, sewing teachers, eight in number, teach classes of girls of the fourth, fifth, and sixth grades. Seven thousand girls are taught plain sewing, running, hemming, felling, darning, and button-hole stitch, etc. This work has served a double purpose—the one for which it was designed (that of giving instruction in sewing), and another, that of increasing the interest in other school work. It refreshes and invigorates; it introduces a marked change which breaks up the oft-time dull routine so destructive to the spirit of real intelligent work.

"Two thousand girls from the seventh and eighth grades and from the high school

receive instruction in cooking at the hands of nine teachers. Each cooking-school has for its use a kitchen and a mixing-room complete in their appointments. Each is also supplied with blackboards for the representation of many of the food substances which, without such aid, would be less thoroughly understood. Instruction is given on food materials—their nature, sources, effects on both body and mind and consequent relative values. Much of the work makes application of the physics regularly taught in the schools. This, with the thorough study of food materials, the experiments, observations, and inferences made by the pupils, gives the work in cooking a scientific and at the same time a practical basis."

"Twelve teachers are required to teach seventeen hundred boys from the seventh and eighth grades from the high school. The course commences with the seventh grade. It includes the correct use of tools, the laying out of the work, with the aid of knife, pencil, and try-square, and the making of chamfered blocks, mouldings, and various T-joints. Simple special pieces are made, such as tool-racks, shelves, and squares for school-room use. Towel-racks and steps for the cooking-schools are successfully undertaken. Originality is developed by designing and by making objects which are constructed from original working drawings. The eighth grade shows more difficult constructions than the seventh.

"In the high schools many articles of school furniture are made for the laboratories, the cooking-schools, and the other schools."

It must not be supposed, however, that the important and, useful information here given can be lightly obtained; for manual training must necessarily add to the cost of the schools. The entire cost of manual training for the past year was \$2.27 per pupil; making the cost of the school (per pupil) without manual training \$18.80; with manual training, \$21.07.

KINDERGARTEN.

Superintendent Powell regards the kindergarten as one of the most important introductions into and changes of the school system, and he recommends that two or three more be established in those parts of the city where the mothers are required to go from home to engage in their work.

FLORIDA.

[From Report for 1888 of State Superintendent Albert J. Russell.]

GENERAL STATEMENT.

Schools for the instruction of white and colored youth are now established in all parts of the State; and, according to the school census of 1888, over seventy-two per cent. of the children are attending them. As the older freedmen are passing away, and the children of both whites and blacks have now had the advantages of schools for several years and have availed themselves of them, the cloud of illiteracy is fast disappearing. Teachers and school officers have joined heartily in their efforts to make the schools successful.

PROGRESS OF THE SCHOOLS.

Since the school census of 1884 was taken there has been an increase of thirty-nine thousand in the number of children of school age, six to twenty-one years of age. The increase in total attendance has been 24,012, and in average daily attendance 17,249. The number of schools in 1888 was 2,249. Neat, comfortable, and well-furnished school-houses have been gradually displacing the old log houses; and in the cities and larger towns many large, commodious buildings have been erected. In 1882 there was an expenditure for school purposes of about \$117,000; in 1888 the expenditures amounted to over \$484,000, an increase of more than \$366,000.

EQUIPMENT OF SCHOOLS.

In several counties of the State the schools are well supplied with maps, globes, charts, and other apparatus for the practical illustration of lessons; but in other schools there is a great lack of these articles so essential to good school work.

CONVENTION OF SUPERINTENDENTS.

A convention of county superintendents was held at De Funiak Springs and was attended by the superintendents of seventeen counties. These found much to interest, instruct, and encourage them in their work.

INDUSTRIAL TRAINING.

The State board of education made earnest efforts to secure the introduction of industrial training into the public schools, and met with considerable success, as industrial training is now taught in the normal colleges and in many of the larger city and village schools.

PRIVATE SCHOOLS.

According to the reports of the county superintendents there are now 137 colleges and private schools in the State, all of which are in a prosperous condition.

ARBOR DAY.

The 8th day of February, 1888, was appointed by the Governor as a suitable time for Arbor Day. The reports showed 450 schools with 18,542 pupils participating, 4,408 patrons and friends present, and 7,490 trees planted. All the people seem to appreciate and take great interest in the observance of such a day, inculcating as it does the importance of preserving and planting trees and flowers, and of beautifying school grounds.

TEMPERANCE INSTRUCTION.

Among other regulations prepared by the State superintendent of public instruction and adopted by the State board of education was the following: "The evil of intemperance abroad in the land demands the attention of all true men and women everywhere, that its tide may be turned back and the great social evil abated; therefore, the State board of education calls upon all county superintendents and county boards of public instruction to see that the pupils are, from time to time, as the regular work and duties of the school will permit, impressed with the evils flowing from the use of intoxicants and narcotics morally, physically, socially, and financially, so that a wholesome conception of the evil and ruin wrought by them may be had by every pupil."

GEORGIA.

[From Report for 1887-88 of State Superintendent James S. Hook.]

Superintendent Hook in the opening of his report pays a worthy tribute to the memory of his distinguished predecessor, Dr. Gustavus J. Orr, who for nearly sixteen years was in charge of the public education of Georgia and who died with his armor on, falling like a true and valiant soldier at his post. His was a life consecrated to noble and untiring efforts to advance the educational interests of Georgia; and he may be said to have sacrificed himself to the behests of duty, striving ever, as he did, with exalted purpose, unflinching zeal, and untiring energies to meet the onerous labors of his office and secure for the people who confided to him the honorable trust the highest attainable moral and intellectual development and advancement. He has left the bright impress of his noble work upon the public school system of Georgia.

COMMON SCHOOL SYSTEM.

Whatever opposition may have existed in the past to a common school system, it is now universally admitted that every child in the State is entitled to receive full instruction in the elementary branches of an education which will enable him to engage successfully in the trials and duties of life.

"So far as our State history in reference to education discloses, the principal trouble here in the way of State aid for many long years had its origin in the adjustment of the *modus operandi*, and not in any spirit of opposition to the principle and policy. From our earliest existence as a State, the need and vast importance of general education were felt, and in various ways, and through very able, distinguished, and influential sources fully declared. The free school and poor school systems of the past, though doubtless well intended by their projectors, were found to be failures for several reasons, but chiefly because of the honest and just pride of honorable poverty, which naturally felt sensitive over the line of distinction thus drawn between the children of the rich and the children of the poor. No system could be effective and popular that excluded the sensitive poor from its benefits."

This serious obstacle to public education was early recognized, and the Legislature was advised time and again by the different Governors of the State to remedy it.

"Now that our State, after years of anxious solicitude in behalf of popular education, has reached and adopted an educational system of perfect equality, adapted to the wants and conditions of all, without grating upon the sensibilities or wounding the just pride of any—a system full of wisdom and designed to give every child in the State, rich or poor, white or colored, a liberal elementary education, the grave question, how shall this system be sustained and made to dispense its untold and unspeakable blessings to our

whole people and to coming generations, presents itself at the threshold and demands wise legislative solution and prompt action."

LENGTH OF SCHOOL TERM.

The superintendent urges that the common schools, instead of continuing for the short term of three months, shall be open for six months, and this would leave sufficient time for the pupils whose circumstances require them to labor during a portion of each year. In order to maintain the schools for six months it would be necessary to secure \$1,260,000, besides the cost of operating the system, which would be somewhat greater than at present. Different methods are suggested by which the amount could be raised, the first being by an assessment of two mills, if the people would consent to additional taxation. If not, then it is claimed that the income from the State Road belongs to the school funds. Also that the bonds issued in 1858 for a school fund, amounting to \$350,000, and which were afterwards destroyed, still constitute a just debt against the State.

LOCAL TAXATION.

A large number of the towns and school districts would be willing to impose a local tax upon themselves for school purposes, and it is suggested that the Legislature pass an "educational local option law" by which this could be done. If good country schools were established in every neighborhood, many of the citizens who now find it necessary to send their boys and girls off to towns and cities for an education would be spared this expense. Atlanta and other cities and some of the counties have already been authorized to impose local taxes, and it is suggested that a general law on the subject be enacted.

PRIVATE SCHOOLS.

The number of private high schools was 104, and of private elementary schools 718. The latter employed 804 instructors and had an attendance of 21,271 white children and 6,197 colored. No reports of private high schools were received from ninety counties, and of elementary schools from eighty-one counties, so the number of such schools was really much greater than at first seems.

THE CONSOLIDATED SCHOOL LAW.

Considerable doubt existed in the minds of a great many teachers and school officers as to the effect of the new school law enacted in 1887, "To amend, revise, and consolidate the common school laws of the State of Georgia, and for other purposes." A circular was issued by Superintendent Hook giving full information as to his understanding of its effects.

TEACHERS' EXAMINATIONS.

The new school law required the questions for the teachers' examinations to be furnished by the State school commissioners, and in some counties of the State difficulty was found in obtaining a sufficient number of teachers possessing the necessary qualifications. A large number of applications for State licenses to teach were made to the State superintendent and ninety-six were granted. Most of them were to white teachers, but quite a number to colored teachers who were highly recommended by their respective county school commissioners, and whose examination papers evinced fine qualifications.

SCHOOL CENSUS.

An enumeration of the school population was made during the year, which showed the population from six to eighteen years of age to be: white, 292,624; colored, 267,657; total, 560,281. "This work was more slow in its accomplishment than was anticipated, but the returns, which we have thoroughly examined, show the work to have been carefully done, and the tables we furnish may be regarded as accurate and correct."

IDAHO.

[From Report for 1886-87 and 1887-88 of Territorial Superintendent Elias W. Moody.]

GENERAL STATEMENTS.

The evidences of progress in the educational interests of the Territory are very striking. While there has been great increase in wealth and population, the schools have experienced a growth equally great. In 1870 the total number of children of school age was only 888; now it is 20,130. In that year only \$9,226.06 were expended for education; during the year 1887-88 over \$138,662.56 were expended. The number of schools has greatly increased, and the number of teachers who have undergone special instruc-

tion for their work is much larger than heretofore. The law creating the office of county school superintendent, separate and distinct from that of county auditor or probate judge, has had very beneficial effects upon the schools and has secured much better supervision of them.

There are numerous private and sectarian schools scattered throughout the Territory from which no information has been obtained.

The Indians in the Territory have good schools, and those of them who have been educated at the Indian training-schools are growing up and beginning to influence very much the Indian character.

REPORTS OF SCHOOL OFFICERS.

The counties are so large that it is impossible for the county superintendent to visit all portions of them and obtain by personal observation the necessary information concerning the schools. He is compelled to rely upon the local school trustees for this information; but as these officers are chosen at a popular election they are frequently men of no education, have no interest in schools and never visit them; consequently it is impossible to obtain accurate and reliable school statistics from them.

SCHOOL ACCOMMODATIONS.

There has been such an increase in the school population and school attendance that the buildings are entirely inadequate to the comfortable accommodation of the pupils. In many cases from fifty to seventy children are crowded into rooms where provision had only been made for thirty or forty. This, of course, interferes very much with the good order and progress of the school, as well as endangers the health of the pupils. In other cases it was found necessary to divide the pupils and let each division come at a different time of day, and in still others the plan of dividing the district was tried, which is not desirable. In some districts the houses belong to different religious societies.

In all the new school-buildings much attention is given to proper ventilation, light, and heating; but in the old school-houses much improvement can not be made in this respect.

The chief difficulty in obtaining a sufficient number of suitable school buildings is a want of funds, caused by the unwillingness of the county commissioner to levy more than the minimum tax of four mills. In the new communities, where land is not yet patented, only the improvements and personal property of the settlers are taxable, and these are never assessed at more than one-half of their real value, so that a tax of four mills is only equivalent to two mills on the real value of the property. The school fund suffers a loss now from the payment of collector's fees, which the "salary bill" passed by the Fourteenth Legislature seemed to authorize, but the general school law forbids the receiving of such fees. If it should be deemed proper that a collection fee be retained, it should be paid out of the current fund of the county and not out of the school fund.

Not only is there an insufficient number of good school-buildings, but it was found upon inquiry of the county superintendents as to the number of schools supplied with water-closets that a disgraceful state of affairs existed in this respect and without excuse, but an improvement has now been made.

DISTRICT BOUNDARIES.

On account of the Territory being settled before government surveys were made, the school districts were bounded by mountain ranges, creeks, canyons, etc., so that it is often difficult to know the exact boundaries, and there results confusion in getting an accurate school census and in levying special district taxes.

TEXT-BOOKS.

The adoption of a uniform series of text-books for each county gives general satisfaction to both teachers and patrons. Every county in the Territory has adopted a series.

TEACHERS.

Some trouble was caused during the year by the demand of reputed leaders in the Mormon Church that the schools in Mormon districts should be taught by teachers of that faith or else the children would not be allowed to attend. The trustees refused to comply with these demands, claiming that under the provision of law forbidding that certificates be granted to any but law-abiding citizens and persons of good moral character, they would not be justified in licensing any member of an organization which teaches or encourages bigamy or polygamy. While some parents may have kept children from school at first on this account, it is probable that their opposition gradually gave way.

The law permitting teachers who have taught five years in any one county to teach

after that time without further examination should be repealed; for very great improvements are made in the methods of teaching, and the standard of teachers' qualifications is raised from time to time, so that an occasional examination should be required of all teachers. The requirement that teachers shall be examined in geology keeps out of the profession some who are otherwise fully qualified to discharge its duties.

COMPULSORY EDUCATION.

The enactment of the Fourteenth Legislature to secure compulsory attendance was very defective, and while some of the superintendents report it as having been enforced, others state that it has been a dead letter upon the statute book.

SCHOOL LANDS.

Of the seventy-two sections authorized by Congress to be withdrawn for the benefit of the university, all but 1,906.15 acres have been selected. Sections sixteen and thirty-two of each surveyed township have been set apart for the common schools, but no authority for their disposal or management has been given any of the Territorial officers, and unless this is done by Congress, they must lie idle until the Territory is admitted as a State. Many of these tracts are situated in thriving and populous communities, and, under a management of school officers, might be made to yield considerable revenue.

ARBOR DAY.

The Legislature passed a bill making the last Monday in April a legal holiday, so as to encourage the pupils in setting out trees and in other ways beautifying their school-grounds. A programme of exercises suitable to the occasion was issued by the State superintendent, together with essays by prominent writers as to the importance of inculcating in the children a high appreciation of the benefits conferred by forests and the necessity of their preservation. On account of the difference in climate and altitude, however, it was found that the date did not suit some localities, and in some places no trees were planted because there were no fences to protect them from stock. But in many instances the day proved to be a most happy and profitable one.

DAMAGE TO SCHOOL PROPERTY.

Under the present criminal code of the State, any one injuring school property in any other manner than by fire can only be punished for a misdemeanor, and it is necessary that severe punishment be visited upon those doing such damage. One case particularly is mentioned where a school-house had been erected by the voluntary labor and contributions of good men, but which was badly damaged by lawless persons.

TEMPERANCE INSTRUCTION.

The act of Congress requiring instruction in the Territorial schools as to the effects of alcoholics and narcotics upon the human system has been generally enforced. Some of the teachers state that it is impossible to comply absolutely with the letter of the law, and in some communities it could not be enforced on account of the strong opposition among the people; but every possible effort has been made to have it enforced, and school officers have been informed that no teacher could be employed in the public schools who refused to comply with this law.

RECOMMENDATIONS.

The superintendent recommends: That the clerk of the board of trustees be made school census marshal, and that the fee for enumerating children be reduced to five cents per capita.

That all persons qualified to vote at general county elections be entitled to vote on all matters pertaining to the schools.

That districts be forbidden to incur any debt, other than bonded indebtedness, beyond the amount of money actually on hand for its payment, so that the teachers may not be required to wait for payment of their claims.

That the acts creating the independent districts of Lewiston and Boise City be so amended as to place them under the same supervision as the other schools.

That the salary of the State superintendent of education, which is twelve hundred dollars per annum, be increased to a reasonable amount.

[From Report of the Territorial Superintendent to the Governor, 1883.]

"The difficulties of preparing accurate tables of statistics have been greatly increased through the neglect of the district trustees to properly perform their duty in promptly forwarding reports required by law. Our school law seems to be defective in not providing suitable means of enforcing the performance of that duty, and inasmuch as the

neglect of one district renders all reports incomplete and places it beyond the power of those charged with the duty of preparing statistics to do so in a satisfactory manner, some remedy should be provided by the Legislature.

"Ours is a 'district school' system, the affairs of each district being under the immediate control of a board of three trustees, elected by the people of the district, and whose duties are to employ teachers, fix their salaries, and to visit the school once each month, together with the other duties usually incident to the office named.

"Each county of the Territory has a school superintendent, to whom the trustees must annually report, and who, with the county auditor and treasurer, manages the school fund. He has the usual powers of county superintendents in the Eastern States; must visit each school annually, examine candidates for teachers' licenses, and enforce the provisions of the law concerning the carrying on of the school affairs of his county. He must render annual reports to the Territorial superintendent, showing the condition of the schools of his county. Such reports are not due until the first day of November of each year."

SCHOOL-HOUSES.

"Since my last special report for 1887 I have reason to think that there has been an increase in the number of school-houses, the title to which is vested in the district. So far as reported, however, there is still one-third of the districts which do not own their houses. The same reasons exist for this as given in that report:

"(1) New districts are frequently created by the county commissioners, and such districts as a rule do not erect houses until some time has elapsed after their organization.

"(2) Many of the houses have been erected on non-patented lands and are not reported by the trustees as belonging to the district.

"(3) The title to the land not being on record, and the houses used for holding the schools having in many instances been erected by neighborhood subscriptions and being used for both school and religious purposes, they are not reported as district school-houses. I have, as far as possible, urged the districts to secure the title of the houses, but, for the reasons above given, have not, except in a few instances, succeeded to my own satisfaction. Aside from the fact that certain communities are opposed to the public schools unless the control thereof can be held by the church whose members are the most numerous in the district, I find that in districts settled by people who have entered Government land there is a feeling of both willingness and helplessness in the matter of erecting new school-houses. Until the lands are patented the school tax is not levied on anything save the personal property and improvements of the entryman. We have no general fund provided for the building of such houses. Our law provides that a special tax in each district may be levied for such purpose when a majority of the resident freeholders and heads of families shall vote in favor of such tax; and it has been my observation in many instances that while the majority of the people have been willing, yet the interests of the more wealthy have led to the defeat of the proposed tax. I believe that so long as the doctrine that the public schools are a part of the 'police power' of the land is maintained, the property qualification of the voter should be abrogated; if this is not done, the many will be helpless against the few. The long interval between the time when the settler proves up and gets his final receipt and the time when his patent is forwarded from the General Land Office allows the entryman to enjoy all the privileges of a freeholder without helping to bear the burden of the public school system. The special tax, if voted, must be levied upon such property as is upon the assessment roll; therefore the tax is often unjust and unequal, enabling the wealthy land-holder to escape from paying his due proportion so long as the land he owns in the district remains unpatented, and compelling others, who have perfected their title and have the same on record, to pay the amount of their assessment. For this reason adequate funds often can not be raised to provide suitable buildings. No special tax can be levied exceeding one per cent. on the dollar of taxable property in the district as shown by the assessment roll. The law of Congress forbidding the incurring of indebtedness exceeding four per cent. of the assessed valuation tends, in my opinion, to prevent many districts from issuing bonds for building school-houses, inasmuch as the limitation is too strict. Increase in wealth will hereafter remove this bar, but we need the houses now."

COMPULSORY EDUCATION.

"The parents and guardians of all children between the ages of eight and fourteen years are required to send such children to school for at least twelve weeks in each school year, eight weeks of which must be consecutive. This act applies only to those residing within two miles of the school-house. A failure to comply with the law subjects the guardian or parent to a fine of from five to fifty dollars. Under the exceptions in this law many parents are avoiding its operation by setting up the excuse that their children are taught in private schools or at home, which is a valid excuse but affords an opportunity to those whose religious belief opposes the employment of Gentile teachers to

keep their children away from the public school of the district. I have not heard of a single fine being collected, and believe that such a law is of no benefit until thoroughly amended."

ILLINOIS, INDIANA, AND IOWA.

The School Reports of these States were not received in season for use in this connection. If possible, digests of them will be given at the close of the volume. See Index.

KANSAS.

[From Report for 1886-87 and 1887-88 of State Superintendent J. H. Lawhead.]

FREE TEXT-BOOKS.

Superintendent Lawhead suggests that the schools be placed still further within the reach of the poor by the adoption of free text-books, the districts buying and owning them, and allowing the pupils the use of them under certain regulations. The plan has been tried in a large number of places, and in some places for quite a number of years, until it can no longer be considered an experiment; and it has given satisfaction wherever tried, few, if any, returns being made to the old system. The testimony of several educators is given as to its success and the benefits to be derived from it. Some of the advantages mentioned are: (1) That the pupils are supplied promptly with books, no delay of a week or two occurring at the opening of the session as under the old plan; (2) it secures complete uniformity; (3) it is much less expensive, as is shown by the reports from those places where it has been tried, a net saving of from \$1 to \$1.50 per pupil being reported; (4) it largely increases the attendance upon the schools, especially among the poor where the purchase of a large number of books for several children at the beginning of the term frequently deters parents from sending some of their children.

GRADING OF THE COMMON SCHOOLS.

The superintendent suggests the following as an outline for the grading of the schools: "That each common district school in the State of Kansas shall be divided into three departments; viz, Primary, Intermediate, and Grammar; and the following branches shall be taught in said common schools:

"*In the Primary Department.*—Spelling: All words on charts or equivalents, first and second readers, by letter and sound. Reading: Through second reader. Writing: Blackboard and slate exercises, forms of letters, and general drill. Arithmetic: Notation to one thousand, addition, subtraction, multiplication, and division tables to the sixes. Language: Write simple sentences, observing capital letters and punctuation; constant drill on correct forms of expression in all recitations. Geography: Oral lessons on points of the compass, county, State, shape of the earth, and geographical terms.

"*In the Intermediate Department.*—Spelling: Oral and written; new words in third and fourth readers; complete first half of speller. Reading: Third and fourth readers completed; all new words defined; use of diacritical marks. Writing: Continue drill on form of letters, and write short sentences with pen. Geography: Elementary completed; map drawing. Arithmetic: Complete fundamental rules; compound numbers; longitude and time; factoring; the G. C. D., L. C. M., and common fractions. Language: Teach subject, predicate, modifiers; analysis of simple sentences; letter writing. History: Introductory lessons in history.

"*In the Grammar Department.*—Spelling: Oral and written; all new words in readers and other books used; proper use of diacritical marks; speller completed. Reading: Fifth reader, sixth reader, or historical, biographical or literary reader. Writing: System completed. Arithmetic: Text-book used completed. Geography: Common school edition completed. History: Common school edition United States, completed. Physiology: School edition completed. Book-keeping: Common school edition completed. Philosophy: Elements completed. Civil government: Primary completed. General lessons, including the effects of narcotics and alcoholic stimulants upon the human system, shall be given in each department."

The pupils shall be examined at the opening of the session by the teacher, school board, and assistant district examiner upon questions prepared by the county superintendent to determine to what grade each pupil shall be assigned, and the same persons shall be the examiners for promotions, and graduation from the grammar department. When any pupil shall have completed the course in any of the departments and passed the examination, he shall be given a certificate to that effect, and shall be entitled to enter the next higher grade in any like school in the county.

SCHOOL TAXATION.

It is stated that to secure anything like equal school advantages, some districts that are financially weak are required to tax themselves almost to the point of bankruptcy. To obviate this injustice a county school tax not exceeding five mills should be levied in each county in the State, cities of the first and second classes being exempted, the proceeds of which should be distributed to the districts in the proportion in which teachers are necessary to supply the schools. If this were done, the levy for school purposes by the county and district should be limited to twenty mills. It is thought that the one-mill levy by the State should be restored, and the amount distributed in the same manner as the present State school fund is apportioned.

KENTUCKY.

For information contained in this Report relating to education in Kentucky, consult the Index. The State School Report was not received in season to make an abstract for use in this place; if possible, one will be given at the close of the Report.

LOUISIANA.

[From Report for 1886-87 of State Superintendent Warren Easton.]

STATE LICENSES TO TEACH.

It is suggested by State Superintendent Easton that provision should be made in the school law for a State board of examiners whose duty it should be to examine candidates for teachers' positions. The certificates should be good for four years and confer the right to teach in any parish in the State without further examination.

URGENT NEED OF EDUCATION.

The reports of the parish superintendents show that there is urgent need of education in the State, that "more than one-half of the voters who go to the polls are unable to tell from their tickets for whom they are voting." One of the main causes of this is the small amount of public school funds, which is only sufficient to keep the schools in operation for four or five months in the year, and even then the pay of the teachers is inadequate. This has caused thousands of young men who could afford it to go to institutions in other States to secure an education. A great many of the people, however, are not even able to send their children to pay schools near them, and hence must depend entirely on the public schools. Strong efforts have been made to induce immigration to the State, but so long as the educational advantages are so deficient immigrants will likely go elsewhere.

THE POLL-TAX AS A VOTING QUALIFICATION.

It is recommended by Parish Superintendent Lipscomb that the payment of the poll-tax be made a prerequisite to the right to vote, and that the tax be increased to \$1.50. By this means sufficient funds would be raised to keep the schools in operation much longer.

EXAMINATIONS MORE RIGID.

In the parish of Avoyelles all teachers are required to stand an annual examination. The percentage required in order to pass has been raised from year to year until now the teachers are required to make eighty per cent. in a maximum of one hundred. As a result, the teachers must keep up their studies, and a higher grade of teachers is secured, many incompetent ones being deterred from applying.

FREE TEXT-BOOKS NEEDED.

In some of the parishes great difficulty is found in getting the pupils supplied with text-books, as many of the parents are unwilling or too poor to purchase them. Especially is this the case with the colored people; and, in many instances, the teacher had to furnish the books himself in order to retain his position.

SCHOOL BUILDINGS NEEDED.

In Terrebonne Parish, and very probably in many others, only a few of the school-houses used belonged to the school authorities; most of them are church buildings, or else erected by private parties. A great many of them are rough frame buildings, without sashes, fire-places, flues, or cisterns. The seats often have no backs, and boards nailed up by the walls are the only desks. Even if the school officers had the means to buy the proper furniture, they would not feel justified in furnishing rough, unsuitable buildings which belonged to private parties.

COLORED PEOPLE WANT COLORED TEACHERS.

Parish Superintendent Lipscomb says there is an increasing disposition on the part of the colored people to have colored teachers. The school boards furnish them colored teachers whenever they can secure competent candidates for the places, but in some cases they are unable to find competent colored teachers and then have to furnish white teachers.

NEW LEGISLATION.

The Legislature, at its session in 1888, adopted act No. 81, revising and consolidating the school laws of the State and repealing all laws conflicting with it.

The State board of education.—By this law the board of education shall be composed of the Governor, State superintendent of public education, attorney-general, and six citizens to be appointed by the Governor, one from each congressional district of the State. The six citizens so appointed shall receive sufficient compensation to cover their actual travelling expenses and per diem for the number of days that the board shall be in session, "the same as members of the State Legislature, payable on their warrants, approved by the president and secretary of the board, out of the school fund." "The board shall meet on or before the first Monday of December of each year, and at other times upon the call of the State superintendent." The State board may require reports to be made by the parish superintendents whenever the interests of the common schools demand it.

Parish boards.—Each director of the parish board shall receive payment for his attendance at school board meetings, when the board shall hold regular sessions on the first Saturday in January, April, July, and October; "provided, that the amount be not fixed by the said board at more than two dollars per diem, and provided that the whole amount expended annually shall not exceed one hundred dollars."

Parish boards may remove parish superintendents.—"For sufficient cause, the parish board of school directors may remove the parish superintendent, subject to an appeal to the State board of education, provided this appeal be taken within ten days after his dismissal. The appeal shall not have the effect of suspending the board's action of dismissal during its pendency, but the parish superintendent shall be reinstated if the State board of education decides that he was dismissed without cause, and reverses the decision of the parish school board."

Parish boards may establish graded and high schools.—"The parish school board shall have the authority to establish graded schools, and to adopt such a system in that connection as may be necessary to assure their success; central or high schools may be established when necessary. The ordinances establishing such schools adopted by the parish school boards shall be submitted to the State board of education, and no high school shall be opened without its sanction, and no such school shall be established unless the amount be donated for the site and suitable buildings are provided for without any expense out of the school fund; provided, that the board of directors of the parish of Orleans shall not require the sanction of the State board for the purposes aforesaid." The State board had previously authorized the establishment of academic schools for the instruction of youth over fifteen years of age.

Provision for fuel and other expenses.—"The school boards shall have the authority to assess and collect one dollar per annum on each family, surviving parent, or guardian, who actually sends a child or children to the common schools of the district, to be collected in such manner as said board shall determine, which amount shall be used in providing the school-house with fuel and defraying the expenses necessary for the comfort of the school."

School district in two adjoining parishes.—"The parish superintendent of two adjoining parishes, where the division line intersects a neighborhood whose convenience requires it, may lay off a district composed of parts of both the parishes; such district shall be reported, together with the census of school children only as belonging to the parish in which the school-house may be situated, by the parish superintendent of the parish; and report shall be made by the assessor and parish superintendent as though it lay entirely in the parish."

Laws of health to be taught, and the French language may be used.—It is required that the "laws of health" shall be taught in every district, and it is provided that the "elementary branches may be also taught in the French language in those parishes in the State or localities in said parishes where the French language predominates, if no additional expense is incurred."

The State superintendent may have a clerk and porter.—The State superintendent may appoint a clerk and a porter; "provided, that the entire expenses of his office, including salaries, postage, and incidentals, shall not exceed the specific appropriation therefor, payable in monthly instalments, out of the current school fund."

Parish superintendent allowed \$125 for expenses.—The parish superintendent, whenever his services are quite efficient and satisfactory, may be allowed a sufficient sum, not exceeding \$125, to defray his necessary expenses in visiting the schools.

Institutes for the improvement of teachers.—The parish superintendents may devote the first Saturday of each month the schools are in session to holding institutes for the improvement of teachers; and any teacher failing to attend or to take such part in the exercises as the superintendent may direct shall forfeit one day's salary unless a satisfactory excuse is given to the parish superintendent in ten days. No teacher living at a greater distance than ten miles or who would have to travel "otherwise than by land" shall be required to attend. Three hours shall constitute a legal session of the institute, and the parish superintendent shall forfeit \$5 for each institute he fails to conduct, unless physically unable to attend, or for other excuse satisfactory to the school board. The institutes may receive as honorary or active members any citizens of good moral character who may desire to attend. The parish superintendent shall cause a roll of the members to be called twice during each day's session of the institute, and a record of the attendance of the teachers shall be kept. All funds of the institute shall be collected by the superintendent and expended only in the interest of the institute. The superintendent shall be paid \$3 a day out of said fund for each day he shall cause the said institute to hold, under his personal superintendence, and for each day's attendance as provided for in section 34. These regulations do not apply to the parish of Orleans, but the school board of said parish may establish such institutes.

Other institutes may be held.—Other institutes may be held between the first day of April and the first day of October, when ordered by the State board or under special laws. Any teacher failing to attend and not rendering a satisfactory excuse to the parish superintendent shall forfeit two days' pay. The sessions shall not be held for more than four days, during which the schools shall have vacation, but no reduction of a teacher's salary shall be made, provided he was present during the entire session. At each session all the common school studies, the school laws, and the work of the teacher shall be considered. The parish superintendent in his annual report to the State superintendent shall give full information as to the institute.

Teachers' examinations.—Before being examined, each teacher shall pay one dollar to the parish institute fund, but it shall be returned to him if he does not receive a certificate. Whenever two or more teachers apply for the same position or positions, a competitive examination shall be held, and the position given to the most competent.

Revenue for schools.—A levy of not less than one mill and a half may be made by the police jurors of the several parishes, or legal representatives of towns, for school purposes. This shall be provided for in their annual budgets. All fines imposed by the district courts and the amount collected on forfeited bonds in criminal cases, after deducting commissions, shall be applied to the school fund.

The schools of New Orleans.—All the public schools of New Orleans shall be under the control of a board of directors of twenty members, eight appointed by the Governor and twelve elected by the city council. The mayor, treasurer, and comptroller of New Orleans are entitled to take part in all deliberations for maintaining the schools, but shall not have the right to vote. The board may elect a secretary, who must not be a member of the board, and who shall receive a salary of not more than eighteen hundred dollars. His duties, in addition to those prescribed by the board, shall be to make a quarterly report to the State superintendent of the cost of maintaining the city schools, and to keep the accounts of the board in strict accordance with such budget as they may adopt. The board of directors also appoint a superintendent of schools at a salary of two thousand dollars. The certificates of teachers shall be good for three years, after which another examination may be taken, and if the applicant is found competent to teach a higher grade school than the one for which the first certificate was issued, he shall receive a certificate good for five years.

MAINE.

For information contained in this Report relating to education in Maine consult the Index. The State Report was not received in season to make an abstract for use in this connection; if possible, one will be given at the close of the Report.

MARYLAND.

ARBOR DAY.

According to the proclamation of Governor Jackson, Wednesday, the 10th day of April, 1889, was "Arbor Day" in Maryland—the first one of the kind ever observed in the State. It was a bright, warm spring day; and the boys and girls were glad to go out and breathe the pure, fresh air, and to hear recitations about trees and flowers; and the parents and friends of the pupils, too, were easily induced to go with them and to help dig holes and plant trees. Everybody was attracted by the novelty of the scene.

In Baltimore the pupils of all the public schools assembled in their different buildings where they spent an hour or two, before going out, in exercises appropriate to the

occasion, such as the recitation of select pieces from different authors, and the reading of short original essays about trees of historic interest in the United States, interspersed with songs by the whole school. After this they went to the different parks, where they planted silver maples, tulip poplars, sycamores, and other varieties, naming them after Governor Jackson, Mayor Latrobe, Enoch Pratt, and others.

Reports were received from all the counties of the State, showing that everywhere the day was observed by the pupils and many of their friends, and that hundreds of trees were planted; in Frederick County alone it is estimated that five hundred trees were planted.

MASSACHUSETTS.

For information contained in this Report relating to education in Massachusetts consult the Index. An abstract of the State School Report will be given at the close of this volume.

MICHIGAN.

[From Report for 1886-87 of State Superintendent Joseph Estabrook.]

GENERAL CONDITION.

The statistics show that general progress has been made; a larger school enrolment, greater school expenditures, more volumes in the school libraries, the same length of term in the graded schools, but a slightly shorter term in the ungraded schools. It will be noticed that the increase of the private school enrolment is nearly as large as that of the public school enrolment, and consequently the rate per cent. of increase is by far greater.

TOWNSHIP DISTRICTS.

An effort was made in the Legislature to authorize the qualified voters to abolish the school districts and to place all the schools of a township under a township board of managers; and, although the effort failed, the subject is still being considered with great interest at teachers' institutes, county associations, farmers' clubs, and meetings of grangers; and it is thought that in all probability the change will be made. The plan of township districts is very highly recommended by the following State superintendents of public instruction: John W. Dickinson, of Massachusetts; B. S. Morgan, of West Virginia; C. D. Hine, of Connecticut; F. M. Smith, of Tennessee; Solomon Palmer, of Alabama; T. B. Stockwell, of Rhode Island; J. B. Thayer, of Wisconsin; Justus Dartt, of Vermont; J. Q. Stewart, of Pennsylvania (deputy superintendent); N. A. Luce, of Maine; J. W. Patterson, of New Hampshire; J. W. Akers, of Iowa; and J. W. Holcombe, of Indiana.

A resolution was presented and unanimously adopted at the State Teachers' Association that the highest interests of the schools demand that the township be made the unit of the educational system instead of the district.

COUNTY SUPERVISION.

As it was very desirable to entrust school supervision to those who decide as to the attainments of the teachers, an effort was successfully made to secure such legislation as would place the duty of visiting and supervising the schools upon the secretaries of the boards of county examiners. It is thought that if due care is taken to select secretaries who are competent and who will give careful attention to the schools, the change will prove a very beneficial one.

MINIMUM LENGTH OF SCHOOL.

The minimum length of school which will entitle a district to a share of the primary-school interest fund and one-mill tax is three months. Some districts barely maintain their school for this length of time in order to secure their proportion of the public money, while they are abundantly able to support a school for six months. The law requires that all children between the ages of eight and fourteen years shall attend school for at least four months in each year, which, of course, can not be done where the schools are only maintained three months. It is recommended that the schools be required to continue six months in order to share in the public funds.

TEMPERANCE INSTRUCTION.

The law requiring instruction in the public schools as to the effects of alcoholic stimulants and narcotics has been better complied with than ever before. A text-book on this subject is required to be placed in the hands of every child who can read well and understandingly, and it is to be studied in the same manner as history, geography, and the like. In the graded schools two books on the subject must be taught.

TEACHERS' CERTIFICATES.

Four different authorities are empowered to grant certificates: The State board of education, the faculty of the State Normal School, boards of education of schools under special charters, and county boards of examiners. More than nine-tenths of all the certificates are granted by the county boards. First-grade certificates are granted only to those who have taught successfully for at least a year, and are valid throughout the State for three years; second-grade certificates are granted to those who have taught six months, and are valid for two years; third-grade certificates are granted for one year.

MINNESOTA.

[From Report for 1886-87 and 1887-88 of State Superintendent D. L. Kiehle.]

GENERAL STATEMENTS.

The average attendance during the year 1887-88 was slightly larger than in the previous year, the duration of schools was longer, and the expenditure for school purposes much greater, especially for new school-buildings and sites. The value of all the school-houses and sites is now estimated at \$8,162,021, an increase of 18 per cent. in two years.

The number of teachers' meetings and local associations held during the year was two hundred and forty-two.

TEACHERS.

There was a notable tendency towards the displacement of male teachers by females as well as towards an equality of salaries, there being a loss of ninety-seven in the number of male teachers, but an increase of three hundred and sixty-four female teachers; the salary of male teachers was 90 cents less per month, that of females was 32 cents greater. A large number of the teachers are not qualified to discharge successfully the duties of their position, but have been employed through the influence of friends or from feelings of charity. As the school term is becoming longer, and the salary of teachers is being increased, it should be insisted that effective work be done.

HIGH SCHOOLS.

The number of State high schools in operation during the year was sixty-two, with an attendance of thirty-three hundred pupils. The chief obstacle to their success is that so many of their pupils come to them from the common schools with a primary education sadly deficient and unsatisfactory. The high schools have served a useful purpose in bringing to light the defective work of the primary schools. The high school diplomas and certificates of graduation are accepted by the normal schools and colleges of the State, as well as by the State university.

TEMPERANCE INSTRUCTION.

According to the requirement of the Legislature, a commission was appointed to examine the different text-books on temperance and hygiene, and suitable ones were selected to be used in the common schools. A circular containing full instructions was issued to the different teachers and school officers, and efforts made in every possible way to secure their interest in the subject, and, as a result, it has been as well taught as any other branch in the public schools, so far as can be ascertained from the county reports, and the children have taken much interest in it.

PUBLIC SCHOOL LIBRARIES.

According to the provisions of the law a careful selection of suitable books for the different grades of the public schools was made, and, after advertising, the contract for supplying the schools was awarded to the lowest bidder. So far the experiment has proved a decided success. In counties where a large portion of the inhabitants were of foreign birth and with foreign ideas, the pupils have acquired much knowledge of American history and principles, and are rapidly coming into sympathy with American feelings.

FOREIGN LANGUAGES IN THE SCHOOLS.

Particular attention is called to the fact that in some of the schools of the State which are supported by Americans, the language used is un-American, and carries with it traditions and associations connected with different foreign countries, and so the schools fail to harmonize the feelings and ideas of children of foreign-born parents with those of their adopted country. They do not acquire that knowledge of our patriots and statesmen, of the formation of our Government and its subsequent history, which inspires a worthy pride in American citizenship, and a love for American institutions.

COMPULSORY ATTENDANCE.

As the laws relating to attendance of children at school seem to be ineffective, it is suggested that they be so amended as to accomplish the end designed. A large number of parents are so indifferent to the education of their children as to permit them to grow up in ignorance and consequent unfitness not only to secure their own well-being but to become capable American citizens.

SUGGESTIONS.

Superintendent Kiehle thinks that some changes can be made which would prove of great help to the schools.

The present school district system should be abolished and township districts adopted.

The election of a county superintendent, an officer that has much to do with the success or failure of the schools, takes place at the same time as the general elections, and consequently his selection is often to be attributed to political rather than educational influences. In this way, a faithful and earnest county superintendent is often displaced by some one who has made it his endeavor not to qualify himself for the position, but to win the good-will of the majority of the voters. As the position is an educational one and should be entirely disconnected from politics, the officer should be chosen at a special election and should be required to give some evidence of his qualification.

The reports of city superintendents, in cities of ten thousand people or more, should be made directly to the State superintendent, and such cities should not take part in the election of county superintendents.

It is recommended that legislation be made—

- (1) For the licensing of graduates of normal schools to teach.
- (2) For examining and licensing persons to teach in the State who have proper education, skill, and experience.
- (3) For an appeal to higher authority by the district, teacher, or superintendent in the matter of a teacher's qualifications. This is required in the interest of all parties concerned.

MISSISSIPPI.

For information contained in this Report relating to education in Mississippi consult the Index. The State School Report was not received in season to make an abstract for use in this connection; if possible, it will be given at the close of the Report.

MISSOURI.

[From Report for 1887-88 of State Superintendent W. E. Coleman.]

GENERAL STATEMENTS.

Each succeeding year marks a step forward in the condition and effectiveness of the public schools of the State, but that some of them do not share in this advance must also be admitted. Perhaps as much has been accomplished as could be anticipated under the circumstances; but the tax-payers have the right to expect the best possible return for the money expended, and especially that nothing shall be done, or left undone, by the law-makers of the State which shall prevent the schools from reaching the highest point of success.

"The entire school law needs to be carefully and thoroughly revised, its incongruities eliminated, its phraseology couched in language susceptible of comprehension by those to whom its execution is intrusted, and each part considered in relation to the whole, that its unity may be perceived and its successful operation rendered certain."

The law of 1874 has been so amended and repealed that it is impossible for school officers, teachers, and tax-payers to determine what the law really is, so that it should be entirely revised, and all irrelevant and unnecessary matter omitted.

COUNTY SUPERVISION.

The State employs more than fourteen thousand men and women to instruct its pupils, but provides no supervision of the work of this large body of teachers, except the nominal supervision of the county commissioners. It assumes in the first place that the teachers thoroughly understand what and how to teach, and how to manage a school; in the second place, that all the teachers are perfectly honest and honorable and will discharge their duties with the utmost fidelity.

There should be a competent superintendent in each county of the State to examine teachers, help them to organize and classify their schools, suggest various improvements, to ascertain the condition of the school funds of the county and to see that they are properly protected, to conduct teachers' institutes, and to endeavor in every possible way

to improve the condition of the schools. In all private enterprises of great magnitude the employment of supervisors is regarded as essential as the employment of men to do the work itself.

"The city schools and many of the town and village schools are effectively conducted, and clearly demonstrate what can be accomplished when unity of purpose and concert of action are the dominant features in their management; they are systematically graded and classified; specific duties are assigned to each teacher, and the entire work is under the direct supervision of a competent leader, and all work together for the consummation of a fixed and definite purpose.

"What a contrast is presented when the condition of the country schools is considered; each teacher is independent of every other teacher in the county; unity of purpose and concentration of effort are wholly disregarded; the classification is loose and system is unknown; one-half of these schools are taught by inexperienced boys and girls, who should be attending some good school in order to familiarize themselves with that knowledge which they should be enabled to impart to those whom they are pretending to teach; and, in fact, many of these schools are no better than those we had in this State thirty and forty years ago."

SCHOOL FUNDS.

The law should require that the interest on all county and township funds be collected by July 1, or foreclosure immediately declared. School officers too often fail to force a prompt payment on account of the poverty of the debtors, while if the debt were due a bank it would be paid immediately.

An examination of the reports of the county clerks for 1887 and 1888, although they were the same men, show discrepancies in the amounts of county school funds of from one hundred and fifty dollars to five thousand dollars. Equally glaring discrepancies are found in the reports of the township funds; and what is reported as county funds one year will be reported the next year as township funds. County superintendents are needed badly to look after these funds and to see that the interest is promptly paid.

SCHOOL TERMS.

The present school term is entirely too short; and the school boards of every district should be required to maintain a school for six months each year, provided a levy of forty cents for school purposes is sufficient therefor. Any district failing to maintain a school for this length of time should forfeit its right to any part of the public moneys apportioned by the county clerk in August of each year.

SECTARIAN INSTRUCTION.

Although the Constitution of the State expressly declares that no appropriation of public funds shall be made in behalf of any public or private institution in which sectarian doctrines or creeds are taught, this provision is being daily violated in many of the schools. It would be well if this were forbidden in the school laws also.

LANGUAGE OF THE SCHOOLS.

In a large number of the districts of the State the German element of population greatly preponderates, and, as a consequence, the schools are mainly taught in the German language, and sometimes entirely so. Hence if an American family lives in such a district the children must either be deprived of school privileges or else be taught in the German language. In some districts the schools are taught in German a certain number of months and then in English, while in others German is used part of the day and English the rest.

Some of the teachers employed are scarcely able to read or speak the English language; while the first question asked him is whether he reads and speaks German. Many letters were received by the State superintendent from school officers and patrons asking if the schools should not be taught in the English language, and complaining that although living in this country their children are being taught in a foreign language. In Gasconade County German is taught in about twenty-seven, or one-half of the districts. In Saint Louis County there are eighty-four districts; forty of them teach German. Many of the more enlightened Germans prefer that the schools be taught in English, as they are anxious for their children to be Americanized in principles, feelings, and language.

TEACHERS' INSTITUTES.

Although there is no law requiring teachers' institutes to be held, in many of the counties the teachers voluntarily held meetings lasting for two, three, or four weeks in order that they might be better qualified for their regular work. In those counties where the county commissioners took an active part in arranging for the organization of the work the institutes were entirely successful. Much depends upon the kind of conductor the institute has; he may be one whose knowledge is thoroughly classified and

who "presents each topic in its true relation to others to be considered and that have been discussed; earnestness is manifest in thought, word, and action; he loves his work and is master of the situation."

"The second is the talking-machine that is sometimes set to running in the institute; he talks, talks, talks; he assumes to know everything, but is entirely devoid of system or the power to classify." "The third includes the good, the bad, and the indifferent; they are too lazy or too indifferent to make proper preparation; they simply work for the money promised."

REPORTS.

The law requires two reports from each county to be made to the superintendent of education, one from the county clerk and one from the county commissioner. The reports from the county clerks are far more reliable than those from the county commissioners, especially in those counties not under township organization. The reports made to the county commissioners by the district clerks are so late in being forwarded and so incorrectly made out that they are almost worthless.

ARBOR DAY.

The first Arbor Day observed in the State was in April, 1886, but as it was something new and most of the schools had closed, only a few districts paid any attention to it; but in 1887 much interest was taken in its observance by teachers, pupils, and the public generally; and "many a school-yard bears evidence of the labor and care bestowed upon it on that bright spring day."

The Arbor Day of April 6, 1888, was observed by ten times as many districts as both the previous ones together, and the custom has now become fully established, and the day is looked forward to with much interest.

Friday, April 5, was appointed as Arbor Day for 1889; that day of the week being selected because not much is accomplished in a school on the day succeeding a holiday.

"Many of the programmes arranged and carried out on this day have proven beneficial to the community, and the literary merit displayed reflected great credit upon those in charge; and the very fact that a greater interest will be felt hereafter in tree-planting and tree-culture will insure an increased desire on the part of teachers and pupils to furnish the public with a literary treat each recurring Arbor Day."

THANKSGIVING DONATION.

On November 1, 1888, a circular was sent out by the State superintendent calling upon the pupils to do something for the benefit of the poor children on November 29, the day appointed by the President and Governor as Thanksgiving Day, in order that no child should have to remain away from school because of not having the necessary books or suitable clothing.

It was suggested that a "donation party" be held at such hour as the committee of arrangements should determine upon, when some literary exercises might be held and afterwards the parcels and packages delivered. It was felt that the children receiving books and clothing would be disposed to use their opportunities well and to be models of deportment.

This invitation was complied with to a very large extent, and from the letters of different superintendents it was learned that a great many donations of school books, clothing, provisions, etc., were made, and many poor boys and girls enabled to attend school and secure a degree of education which will be of great assistance to them through life.

So highly satisfactory were the results of these efforts that the State superintendent has determined to make this an annual occasion for the distribution of gifts to the poor, and especially gifts of school books and clothing to poor children.

MONTANA.

[From Report for 1886-87 of Territorial Superintendent Arthur C. Logan.]

The public schools of Montana during the year 1886-87 were characterized by an unusual degree of progress and prosperity. The number of pupils enrolled was larger than in the previous year, the amount of school funds was much larger, the teachers were of a high order and were well paid, and the schools were in session one hundred and fifteen days or nearly six months.

INDIFFERENCE OF THE PUBLIC.

The people take sufficient interest in school matters to see that ample funds are provided for them, and that large, commodious buildings are erected, but there they are inclined to stop and leave the rest of the work to the teacher. This indifference is attributed to the lack of information in reference to the schools, as the school officials are

not required to publish any report. In order to overcome this, Superintendent Logan prepared blank reports which are to be filled by the county superintendent and furnished to the county commissioners for publication each December; the reports to give full information as to the schools, the amount of school funds, how apportioned and expended, names of teachers, etc.

COUNTY SUPERINTENDENCE.

Another difficulty in the way of successful school work is the lack of efficient and constant supervision. This is accounted for by the smallness of the salary allowed by law, which ranges from three hundred to one thousand dollars, which in many cases is not more than one-third or one-half as much as teachers under their supervision receive. The result is either that incompetent men are obtained or else men who will only devote the small portion of time to it which they can spare from their regular work. Competent supervision is very much needed, as is shown by the language of Superintendent Logan: "In no State is constant and thorough supervision more needed than in Montana, with its vast territory, its counties larger than ordinary States, its school districts often from fifty to one hundred miles apart, and with a population made up of representatives from every State and Territory in the Union, and from every civilized nation under heaven.

"To unify this heterogeneous mass and marshal its forces under any established system require masterly generalship and constant attention, and this can not be accomplished by one visit a year (this is all the law requires) or on a salary of five or six hundred per year, and I think this point should be considered by those claiming, and perhaps justly, too, that it is a supervision that does not supervise. The question then is, shall we, as many propose, abolish the office or apply the remedy?"

SCHOOL LANDS.

One-eighteenth of the public domain of the Territory was set apart by the General Government for the benefit of the public schools when Montana shall have arrived at statehood. Many of these lands have been honestly claimed by settlers as mineral lands, but many which were not mineral lands have also been claimed. Superintendent Logan urges that strong efforts be made to prevent further encroachments upon these.

DEAF-MUTES AND THE BLIND.

Under provisions of the laws of Montana for the education of the blind and the deaf, seven wards are being educated in Pennsylvania, Maryland, and the District of Columbia at an annual expense of three hundred dollars for each. In addition to their regular education, they are also being taught some trade by which they will be able to secure a livelihood.

[From the Report of the Governor in 1883.]

"The subject of education is a favorite theme in every household in Montana. The people are united and have one common spirit of the largest liberality and eager willingness in sustaining and advancing their public schools. Every child of school age in the Territory is on the school roll and is at school nine months of the year. In this Territory there is in each of the cities and large towns the very best and highest class of graded schools, and in all the schools of the Territory the very best class of teachers, superintendents, etc. Montana has no public school fund, amounting up to millions, as have the people of the States. The school fund for public schools in this Territory is in the hearts of the people and taxation of their property. The entire fund, supplemented by a small amount derived from fines, is raised from year to year by direct taxation. No one complains of it. And yet there is more money paid out per capita for public schools by Montana's people than is paid by the people (including their assistance from their great school funds) of any of the States."

SCHOOL LANDS.

"The support of future public schools in Montana is liberally provided for by the action of the General Government heretofore, in setting apart and donating one-eighteenth of the public lands within the Territory for the benefit of schools, and in pursuance of that law the sixteenth and thirty-sixth sections have been so set apart and designated as school lands for Montana's people. But this grant is withheld from the possession or use and benefit of the people and children of Montana until such time in the future when it may be deemed proper to pass them into their possession and control. It is a matter of grateful pride with these people, through these years of waiting, as they anxiously look forward to the time when they shall be allowed the force of this great accession to their educational facilities; but it is painful, and a source of regret and humiliation to

this people, to see and know of these lands being seized, fenced, occupied, appropriated, sold, and conveyed, and the timber cut and consumed, in the greed and reckless grasping of combined capital and avarice of individuals, without let or hindrance."

NEBRASKA.

[From Report for 1886-87 and 1887-88 of State Superintendent George B. Lane.]

GENERAL STATEMENTS.

The State superintendent announces with pleasure to himself and as an occasion of congratulation on the part of the people of Nebraska that the public schools of the State are in a prosperous condition; that during the last two years there has been increased educational interest and activity, and that the schools have been placed in a condition of much greater usefulness. In 1886 the expenditures for schools did not amount to three millions of dollars, but in 1888 over four millions of dollars were spent. There was an increase also of twenty per cent. in the number of children attending schools.

In 1886 the number of school-houses was 4,267, but in 1888 the number had increased to 5,187, having an estimated value of \$3,689,823; the number supplied with patent desks being 3,977. The first houses erected in a new neighborhood are usually sod houses, and the school-houses are of the same character, but they are much more comfortable than might be supposed; but as the community becomes older and wealth is accumulated the school-houses are frame or brick buildings.

LENGTH OF TERMS.

The average duration of the schools of all the districts was 137 days; the number of districts having a school six or more months being 3,904; the number having four, but less than six months, being 529; the number having three, but less than four months, being 974. Many of the districts reported as having a school more than six months actually maintain a school for nine or ten months.

The law provides that a school shall be taught by a legally qualified teacher not less than three months in a district which has less than thirty-five pupils, nor less than six months in districts that have between thirty-five and one hundred pupils, nor less than nine months in districts which have more than one hundred pupils. The State superintendent thinks it would be wise to require districts having less than twenty-five pupils to maintain a school for three months, and districts having from twenty-five to thirty-five pupils to maintain a school for four months; for many of the districts that are abundantly able to keep up a school for much longer terms refuse to do so from selfish or false ideas of economy.

TEACHERS.

The number of male teachers employed in 1887-88 was 2,752; of female teachers 7,134—a ratio of about one to three, and a much larger proportion of females than heretofore. "The natural delicacy of woman, her sympathetic tendency and quick sensibilities, cause woman's profession to embrace the care and nursing of the body in the critical period of infancy and sickness, the training of the mind in the most impressive period of childhood, the instruction and control of servants and most of the government and economies of the household. How far the education in public schools should be entrusted to women teachers is a question not yet fully settled. I am of the opinion that in this State the selection of women teachers is due to various causes outside of the consideration of the real questions to be determined in hiring a teacher—the securing of the teacher who can produce the best *permanent results* in the school and district.

"In many districts the number of pupils has fallen off, and the money has often diminished accordingly, so that it is impossible to employ an experienced male teacher. The argument of ten dollars difference in the cost of a male and a female teacher is a powerful one, and it is considered best to have a female teacher to teach the pupils, both few in number and small in size. In many cases this proposition is doubtless true, and best under the existing condition of the district and number of pupils."

But when the districts are made as large as they should be, and the schools become correspondingly larger, it is thought that it would be the part of wise management to secure and retain, especially for the larger schools, good male teachers, who could exert a stronger and better influence over large boys.

SCHOOL FUNDS AND LANDS.

"The public schools of this State are sustained (1) from a local tax; (2) from a general State tax; (3) from the interest of the permanent school fund; (4) from lease of school lands; (5) interest from unpaid principal of school lands sold; (6) from certain fines and licenses. The land grants made by the General Government to the State form the basis

of our educational funds. The total amount of land so granted amounts to 2,884,398 acres; of this amount 162,051 acres have been deeded, leaving 2,722,347 acres still held by the State; of this number of acres, with the title still vested in the State, there are under contract of sale 655,431 acres, and under lease 1,427,460 acres, leaving 655,431 acres not yet leased or contracted for sale.

"The present condition of the educational funds of the State is quite unsatisfactory, from the fact that a large part of the permanent school fund is lying in the treasury and producing no income for the support of education."

There has been an increase of over a million dollars in the school fund during the last two years, but of this amount \$270,633.79 is lying idle in the treasury, bringing no income, as the Constitution of the State limits the investment of school funds to United States, State, and county bonds; but these are no longer available. The school district bonded indebtedness of the State is \$5,947,724.30, most of it bearing interest at the rate of seven per cent. per annum and held by Eastern capitalists. "No better securities can be found in this State than registered school district bonds. Would it not be a part of the duty of the State to the school districts to invest its permanent school funds in these district bonds? The interest paid by these districts would be returned by way of apportionment to the school districts, to the great good of the schools and at no loss to the State."

The income received from the leasing of school lands amounts to \$153,276.62. The law required an appraisal of school lands to be made in 1883, and that another appraisal shall be made every five years thereafter. According to the appraisal of 1888 the value of the lands has greatly increased, and as rents are determined by these values, the income to the schools from this source will now be increased more than two hundred per cent.

GRADING OF SCHOOLS.

The work accomplished by the graded schools is very thorough. Especially is this true of the city schools, which are generously supported by the public, and may be regarded as the striking feature of our educational system. But the excellent work of the graded schools should not encourage us to overlook any defects which can be eradicated.

"In our reaction from the 'no-system' methods and plans of the early days, we have swung well over to the other side of the arc, the 'all-system' plan. In our efforts to repair the waste of the former unorganized activity, we have, I fear, developed so much organization in some directions as fairly to give rise to the query whether we have not lost sight of the original idea upon which the whole theory of our education was founded. For one, I am persuaded that the criticisms frequently made, that our graded schools are arbitrary in their organization and tyrannous in their administration, that the system is placed first and education second, and hence that the system is maintained often at the expense of the material for whose welfare and general advantage it was created, are to a certain extent true."

"It would seem that the inevitable existence, even in the best cities, of broad differences in the pupils of the public schools in their social, moral, and intellectual attainments, in their environments, render a degree of elasticity necessary both in the matter of gradation and classification, and also in that of instruction. We should proceed in these things upon the theory of providing equally for all. This principle is often violated by demanding external conformation in organization and course of study."

The courses of study in the graded schools are arranged with the expectation that the children will continue to attend school for ten or twelve years, and the pupils remain in each grade for one year; no provision being made for advancing during the year pupils who show higher attainments or better talents than the rest of the class; but the whole number are chained together, the brighter pupils being held back and the dull ones dragged along in studies which they cannot master. A great many children are required to leave the schools by the time they become twelve years of age, and consequently they desire to advance as rapidly as possible in those studies which they will specially need in the practical pursuits of life. Superintendent Lane thinks that the needs of such children should be considered more, and provision made by which pupils of greater proficiency can be advanced to higher grades at least oftener than once a year.

COUNTY SUPERINTENDENCY.

The importance and advisability of having competent and energetic men to superintend the schools of the different counties is very generally admitted in Nebraska. Their influence is seen in awakening a public interest in schools, and thereby securing a larger, more punctual, and regular attendance, in selecting better qualified and experienced teachers, in better classification of pupils, in the introduction of new methods, etc.

In the schools of cities and towns an efficient superintendent is always employed; but in these schools the pupils are well graded and classified; they attend more regularly than in the country, the teachers are the best to be obtained, and every thing is

calculated to make the schools a success. In the country schools, however, the opposite conditions too often prevail; hence the greater necessity for a competent and faithful county superintendent.

COMPULSORY EDUCATION.

By a recent act of the Legislature of Nebraska all children in the State between the ages of eight and fourteen years inclusive are required to attend a public or private school for twelve weeks or more each year, unless prevented by illness, poverty, inability, or by reason of being already proficient.

This law will likely be the means of securing the attendance at school of many children who otherwise would remain at home. The desire for an education arises from external circumstances and surroundings, not from within; for, as a rule, the less education the people possess, the less desire do they have for it, the law of supply and demand not holding good in this case.

ARBOR DAY.

"The statutes of Nebraska designate the 22d day of April as Arbor Day. This day was originated in Nebraska in 1872. It has since been established in twenty-eight of our States and two of our Territories. The people of the United States realize the importance of forest culture. In no part of the country is it of more importance than in this State. Statistics show there have been planted in Nebraska since Arbor Day was instituted 355,560,000 forest, shade, and fruit trees.

"On this day, above all others, the pupils of our public schools should be educated to care for the material prosperity of the country and to foster the growth of trees. Let teachers, parents, and school officers urge and encourage the children in every school district, town, and city in the State to plant trees on that day in the school yard. Let the child understand that he has a special interest in the tree he plants; that it is his; that upon him devolves the responsibility of protecting and cultivating it in coming years. In every yard there should be system and regularity in arranging the trees, and in cities and towns they should be planted according to artistic designs. The school yards of the State beautified with trees would educate the æsthetic taste of the children and be a material blessing to the country."

The State superintendent sent out a circular letter to each school district in the State with reference to the observance of this day. He reports that it meets the hearty indorsement of teachers and school officers.

COURSE OF STUDY FOR COUNTRY SCHOOLS.

By request the department of education prepared a teacher's guide and course of study for country schools, showing the amount of work which should be attempted and giving such suggestions as to school methods and management as experience showed to be useful. It received much attention at the different meetings of teachers and has been adopted in more than half the counties of the State.

NEVADA.

[From Report for 1886-87 and 1887-88 of State Superintendent W. C. Dovey.]

GENERAL STATEMENTS.

The State superintendent was enabled by personal observation to familiarize himself with the condition of the public schools of the State. He visited during the year a majority of the schools of all the counties but three, making two hundred and fifty school visits in all, and travelled nearly two thousand miles. He reports that the schools are in a fairly prosperous condition, when it is considered how widely scattered are the families of the rural districts: the schools of the cities and towns are doing excellent work; the teachers are well qualified and acquainted with the latest methods of instruction.

According to the school census of 1888 there has been a decrease of one hundred and twelve in the number of children of school age. It is doubtful, however, whether this is really true.

HIGH SCHOOLS.

The high schools of Virginia, Gold Hill, Carson, Reno, and Eureka are worthy of special mention, and have been doing much to supply the place of a normal school. Many graduates from them have each year entered the teacher's profession, and, although lacking practical experience in teaching, their interest and enthusiasm have done much to secure their success. The instruction in the high schools was designed somewhat to prepare the students for teaching. The Legislature passed a bill, however, which was approved February 7, 1887, providing for the establishment in the State University of

a school for the instruction of teachers. This school has been established and quite a number of students have been enrolled.

SCHOOL FUNDS.

The Constitution of the State forbids the investment of the school funds in any other than the bonds of the United States and of the State of Nevada, both of which sell at such a high premium and bear so low a rate of interest that the State board of education thought best not to invest in either, but to wait till the Constitution could be so amended as to permit the investment of school funds in other bonds. The amount of the school moneys awaiting investment December 31, 1888, was \$359,083.02.

SCHOOL LIBRARIES.

Very few school libraries have been established, and none of them in rural districts. A large number of schools, however, have been supplied with Yaggy's Geographical Study and Yaggy's Anatomical Study. Both of these will prove of great value in the school-room. The Anatomical Study will be of great assistance in the instruction of physiology and hygiene, which is now required.

Three hundred maps of the State of Nevada were purchased with the appropriation made by the Legislature for the purpose and were distributed among the schools.

COUNTY SUPERVISION.

"The act consolidating the office of county school superintendent with that of district attorney is, to say the least, a measure of doubtful expediency, and is generally so regarded by the friends of education. It may be that the district attorneys are well qualified, yet the fact remains that the duties of the two offices are foreign to each other, and it may often happen that the duties as attorney would require his entire time when most needed in the supervision of school affairs. The reason advanced in favor of the measure was that it was a measure of economy. The average monthly salary of the county superintendents of schools is twenty-eight dollars. It is not reasonable to suppose that there is a county that can not afford to pay this paltry stipend when it is remembered that there are nearly ten thousand children of school age in the fourteen counties of the State, that there are 238 teachers employed, and that there was expended in 1888 the sum of \$168,852.39 by the State and the several counties for the maintenance of our public schools. This expenditure, far too small, must annually increase. It is clearly manifest that intelligent and well-paid county or district supervision is the urgent need of the State to-day, and until that is provided our school system cannot take that high rank to which it is entitled."

ARBOR DAY.

The language of the act leaves no doubt that it was the intention of the Legislature "to establish Arbor Day as a holiday for the public schools for no other purpose than to afford the teachers, children, parents, and friends time and opportunity to engage, during a portion of the day at least, in planting trees, shrubs, and vines. A respectable number of the schools of the State so employed a good portion of the day, sufficient at least to comply with the letter of the law. There were, however, several schools, some of the largest in the State, that entirely ignored the essential provisions of the act and simply gave a vacation."

"At the State University the day was observed with appropriate exercises and ceremonies by the faculty and students. The board of regents, the faculty, students, and citizens of Reno marched in procession to the grounds already prepared for tree-planting and took part in the planting and naming of many hard-wood trees in honor of prominent citizens, members of the board of regents and faculty, and friends of education generally. When the trees were planted the audience listened to an address by the State superintendent of public instruction and dispersed much pleased with the exercises.

"Arbor Day is becoming very popular throughout the Western States, and has already been instrumental in planting hundreds of groves in what was formerly known as the treeless regions of the West."

SCHOOL TEXT-BOOKS.

As the State of California has adopted the plan of preparing and publishing its own text-books, the question is likely to arise in Nevada also. Superintendent Dovey thinks that, even if the measure should prove successful in California, it would be exceedingly doubtful as to its success in Nevada, where there are only 9,716 school children, while California has 280,000.

LEGISLATION RECOMMENDED.

(1) A law should be passed forbidding the employment of any teacher under eighteen years of age.

(2) The law relating to the apportionment of county school funds should be amended so as to reduce the number of pupils assigned to one teacher from one hundred to not more than seventy-five.

(3) Teachers should receive compensation for the time spent in attendance upon institutes and educational meetings.

(4) Members of the county boards of examiners should be paid for their services.

(5) School boards should be required to expend from fifteen to fifty dollars of the school money apportioned to each district in the purchase of books of reference, maps, charts, and apparatus necessary for the proper furnishing and equipment of the schools.

(6) "The office of county superintendent of schools should be re-created, and salaries commensurate with the duties of the office in the several counties should be allowed. If this cannot be done, the State should be formed into at least three educational districts, and a salary of at least two thousand dollars a year allowed to each of the three district superintendents."

(7) One thousand dollars should be appropriated for the travelling expenses of the State superintendent of public instruction to enable him to visit all the school districts in the State.

(8) "The State superintendent of public instruction should be authorized to make contracts at Berkeley, Cal., for the education of all deaf and dumb and blind children in the State of school age."

(9) "An appropriation of at least five hundred dollars should be made for the purpose of holding State Teachers' Institutes during the years 1889 and 1890."

(10) "The May election law should be made general throughout the State so that it would apply to all districts, and the maximum levy of taxes should be raised to seventy-five cents on one hundred dollars' valuation, instead of fifty, and the minimum should be placed at forty cents. This change is greatly needed in many counties in the State and would prove a benefit to all."

NEW HAMPSHIRE.

[From Report for 1887-88 of State Superintendent J. W. Patterson,]

GENERAL STATEMENTS.

The report shows progress to have been made along the whole line—in the number and duration of schools, enrolment and average attendance, and in the expenditures for school purposes. The reports of city superintendents and town committees state that the teachers have done faithful and successful work in the schools, but that their efforts have been crippled very much by the irregular attendance and tardiness of pupils. Twenty-eight new school-houses were built, and there was an increase of twenty-two in the number of graded schools, which resulted from the union of a number of small schools. In the last ten years there has been a decrease in the public school enrolment of 6,209, while during the same time there has been an increase in the private school enrolment of 6,159, showing the extent to which private schools have drawn from public schools. But the total enrolment of private schools is yet only 7,652, or about one-tenth of the school population of the State.

THE TOWN SYSTEM.

"It will be observed that the number of school districts reported is only two hundred and seventy. This is five less than last year, some districts having given up their special organization and gone into the town system. The average length of the schools in weeks, for the whole State, is 22.9. For 1885, under the old system, it was only 19.95. Thus, it will be seen that the new law gives, on the average, within a small fraction, three weeks additional to every school of the State, or in other words to every scholar of the State, as all enrolled are educated in these schools. This makes an aggregate of 6,826.3 additional weeks of pupilage to the scholars of the State, and no man can measure the financial value or the intellectual and moral power involved in this."

In some of the towns where there was strong opposition to the system, no district taxes were voted, and every other means used to prevent its success. But the success of the system is already assured. In some instances inconvenience was caused by it, but the same was true under the former system. Where the school term has not been lengthened, the schools have had better supervision and the quality of work done has been better.

EDUCATION BY THE STATE.

As the education of the successive generations is necessary to the national and social welfare of the people, that they may fully understand their rights and duties as citizens of the American Republic and be enabled to secure their accomplishment, so it is also

necessary that they should be educated in accordance with the spirit and genius of the institutions which it will be their duty to maintain. "A company of anarchists can not be allowed to school their children into hatred and disloyalty to the republic, nor any religious organization to teach polygamy or the subordination of civil to ecclesiastic authority in affairs purely temporal." While it is necessary to exclude from the public schools the inculcation of the doctrines of any particular sect or religion, it is equally necessary that the pupils should have implanted in them a love and admiration for those cardinal virtues which constitute an honorable character.

IRREGULAR ATTENDANCE.

The main obstacle to the progress and prosperity of the schools is the great irregularity and tardiness of pupils. This is a cause of complaint in quite a large number of the reports from the towns. In this matter a large part of the blame attaches to the parents who not only allow their children frequently to stay at home to play, but in many cases keep them at home to go on errands or to perform some piece of work, thinking that the loss of a day or two from school is of no importance. This is an evil, however, that is with difficulty eradicated.

TEXT-BOOKS.

The State superintendent thinks that the free text-book system should be adopted, but has not urged it so far, fearing that it might be put into operation in such an unbusiness-like way as to cause dissatisfaction. He claims, however, that as the State furnishes the school with a house, seats, stove, fuel, charts, desks, etc., because it is for the public welfare, it should for the same reason furnish all the scholars with text-books, not simply the children of the poor. A child does not wish to be singled out as an object of charity, nor does it tend to develop a feeling of manliness and equality to which the children of the poor are entitled; but, on the contrary, when free text-books are furnished the poor, it develops in the other children an idea of superiority and arrogance which should not be encouraged.

An act to furnish free text-books came before the last Legislature, and was passed by the House by an enthusiastic majority, but the Senate concluded not to pass the bill at that time. It is a noteworthy fact as soon as the bill had passed the House immediately a large body of book-agents and book-sellers hastened to Concord to give the Legislature of the State instructions on the subject of free text-books.

NEW JERSEY.

[From Report for 1886-87 of State Superintendent Edwin O. Chapman.]

GENERAL STATEMENTS.

The report was rather late in being finished as the State superintendent was anxious that the statistical tables should be absolutely correct, and returned for correction several district reports in which errors had been made. All of the county superintendents whose terms expired were reelected by the State board of education except two, one of whom died. The schools throughout the State were in operation nine months and ten days at a cost of \$2,074,692, or \$9.21 for each child that attended, besides about a half million dollars expended for new buildings and repairs. The total value of the school property of the State is seven and a half millions of dollars. "The decrease in the State school tax was caused by the decrease in the census taken the previous year, and this, as explained in my last report, was due to technical errors made in previous years, because of a misunderstanding of the law."

TEACHERS AND SALARIES.

"The most encouraging facts to be noted are the increased zeal and efficiency of the teachers, and these cannot be shown by statistics. They are the direct results of the faithful labor of the county and city superintendents in the local associations, of the work done in the institutes, and of the honest efforts of the teachers themselves. The teachers' Reading Circle has contributed in no small degree to this improvement. It has opened new fields for thought and investigation, stimulated professional zeal and made the work of the school-room less irksome to the teacher and more profitable to the pupil."

Of the entire number of teachers employed, which was 4,002, only 825, or less than 21 per cent., were men; while in the cities the proportion of men was still smaller, being only about 12 per cent. "While nothing is to be said against the faithfulness and efficiency of our female teachers, it is to be regretted that more men do not find employment in the schools, especially in the large schools of the cities."

There was a decrease in district school taxes for teachers' salaries, but this was more than counterbalanced by the increase in township taxes. The average salary of men throughout the State was \$64.07, an increase of \$1.06; the average salary of women was \$41.34, an increase of 83 cents.

"This increase in salaries was in part effected by the operation of a law passed by the Legislature during the previous winter, which provides that at the close of the school year any balances of the State appropriation remaining in the hands of township collectors may be reapportioned by the county superintendent among the districts of the county. In some portions of the State, trustees had fallen into a habit of letting a portion of each year's appropriation remain in the hands of the collector, and, in many instances, those balances had accumulated until they aggregated more than the annual appropriation from the State. As the appropriations were made for a definite time, namely, the school year, and for a definite purpose, namely, the purchase of fuel and the payment of teachers' salaries, such accumulation of balances was an evasion of the spirit if not of the letter of the law. The appropriation for any single year is made for the benefit of the school children of that year, and the children of that year are entitled to it all. Very few balances have been taken up and reapportioned under the law, but the trustees have been induced to apply them to increase salaries."

As the Legislature has raised the State tax from four dollars per child to five dollars, and as this fund can only be used for payment of salaries and fuel, the teachers' pay will hereafter be much larger, probably increased from ten to twenty per cent. This is greatly to be desired, as there is no other professional class so poorly paid as the teachers, and none are more faithful and efficient than those of New Jersey.

EXPERIENCE OF TEACHERS.

As to the experience of teachers in school-work, the schools of New Jersey will compare most favorably with those of any other State; and when the terms of service in the same school are considered, no better proof of the success and thoroughness of their work could be given, for, however high may be the attainments of a teacher, nothing can supply the place of that knowledge and skill which can only be acquired by practical work in the school-room. In many cases the teachers refused flattering offers in other States, preferring to remain at the same place, although at a small sacrifice in salary. The average experience of all the teachers of the State was seven years and six months, and the average length of service in the same school was four years and eight months. Only about ten per cent. of all the teachers in the State had an experience of one year or less, while nearly fifty-five per cent. had an experience of more than five years, nearly thirty per cent. of more than ten years, and a large number had served more than fifteen years. In the city schools, if considered by themselves, the result is still more satisfactory. There the average experience of teachers is nine years and four months, and only six per cent. of them had an experience of one year or less, while more than sixty-two per cent. have taught more than five years, and about thirty-six per cent. more than ten years. The average term of service in the same school in cities is seven years and four months, the highest average being in Gloucester, where the teachers have been retained in the same schools an average of thirteen years.

TEACHERS' CERTIFICATES.

"The State board of examiners has issued during the year nine first-grade State certificates, twenty-four of the second grade, and twenty of the third grade. Great care has been exercised to place these certificates in the hands of those teachers who not only possess the academical qualifications required, but who are also in other respects thoroughly qualified. While scholarship is essential to the teacher, the ability to control and to teach is no less so, and therefore the board has not depended solely upon an examination as a test of qualification, but has required of the applicant a record of successful experience as teacher and as principal. The State certificate of the first grade is the only diploma that marks the holder as one who has fairly entered his profession, and one who is thoroughly equipped for its practice. It should be the aim of every teacher in the State to pass through the stages of apprenticeship as soon as possible, and secure this final guarantee of fitness.

"Of county certificates, 1,932 have been issued as against 1,925 during the previous year. About eight per cent. were of the first grade, and about fourteen per cent. of the second grade. This is a decided improvement over the previous year, when only four and one-half per cent. were of the first grade, and only ten and one-half per cent. of the second grade. That seventy-eight per cent. of all the teachers applying for examination are satisfied with a certificate of the lowest grade is not creditable to the aspirants; such a certificate will do very well for a beginner, but no teacher should be contented to remain on this lowest round of the ladder for any considerable time."

SCHOOL BUILDINGS.

Fewer districts raised special taxes for building and repairing, and less money was raised than in the previous year, yet thirty-three new houses were erected and other improvements made to the extent of \$223,167. Although one hundred and fifty houses are reported as "poor" or "very poor," it is very probable that a great improvement has been made in their general condition and that houses which were formerly reported as "good" are now returned "poor," their condition now being compared to new and elegant buildings while formerly they were compared to crumbling and leaky buildings which have given place to better ones. Still there are left a great many dilapidated and incommensurable houses which should be discarded. Under the law passed in 1886, school districts can borrow money at five per cent. from the State school fund for the purpose of erecting buildings, and make gradual payments until the debt is extinguished. As a large sum of money is spent annually for the erection of school-houses and as many applications are made to the State superintendent for plans and directions for buildings, he recommended that an appropriation be made for this purpose.

Not only are there many school buildings not suitable for the purpose, but there is not a sufficient number of such as there are; particularly is this true in the cities. In the entire State sixty-one per cent. of the school population was enrolled, and if the cities are taken by themselves, fifty-two per cent. were enrolled. As a great many of the school-rooms were greatly overcrowded, we can conclude that the present school buildings are very inadequate to the comfortable accommodation of the school population, and hence it is not strange that the law for compulsory education is a dead letter.

OVERCROWDED ROOMS.

So great has become the crowding of children into school-rooms, that it was thought advisable to collect the statistics on this subject, and we find that the evil is now diminishing although it has not by any means disappeared. In 1883-84 there were one hundred and sixty-two rooms having eighty pupils or more, in 1885-86 there were one hundred and seven, and in 1886-87 there were ninety-two, and of these fifty-two were in the cities.

In the entire State there were forty-one rooms having from eighty to ninety pupils, twenty-six having from ninety to a hundred, and twenty-five having more than one hundred. Not only is it impossible for one teacher to properly instruct so many children, and in the overcrowded rooms the children are usually quite young and therefore need much more personal attention, but there is great danger of serious injury to their physical health on account of imperfect ventilation and other unavoidable evils.

FURNITURE AND SUPPLIES.

In this respect a great improvement has taken place since the last report was made. Fifty-five more school-houses have been furnished with the modern patent desks, but there are still two hundred and forty-six buildings not supplied with them. Quite a number of schools have been furnished with maps, charts, dictionaries, etc. "In the matter of blackboards no improvement has been made, there still being two hundred and seventy-one schools insufficiently supplied, principally in the counties of Monmouth, Middlesex, Morris, Cumberland, and Sussex. The trustees are much to blame for neglecting to supply so important an aid to their teachers, and perhaps the teachers are not entirely blameless for not pressing the matter more frequently upon the attention of school officers."

ATTENDANCE OF PUPILS.

The last school census showed the population of school age to be 374,011. Of this number 61 per cent. attended public schools, 10 per cent. private schools, and 29 per cent. no school at all. This is a much larger number of children not attending school than can reasonably be accounted for, and shows that quite a number of the children are growing up in ignorance. A large part of the non-attending children are in the cities where it has been shown there was a great lack of school accommodations, and no doubt this was, to some extent, the cause of the non-attendance. In thirty-one cities and boroughs only eight had an enrolment of 70 per cent. of their school population, while nine enrolled less than 50 per cent. This is conclusive evidence of the need of greater school accommodations, as even with the present small attendance the schools are overcrowded.

SCHOOL TERM.

The average school term throughout the State was nine months and ten days, the longest being in Mercer County, ten and two-tenths months. Only two counties, Atlantic and Ocean, had an average term less than nine months, as required by law, the average of the former being eight and eight-tenths months; of the latter, eight and five-tenths

months. In the cities, considered by themselves, the average term was ten and one-tenth months, all of them keeping their schools open ten months except Atlantic, where the term was nine and five-tenths months.

TEXT-BOOKS.

"The constant improvement in text-books is a marked feature in the progress of our educational work. The books are now all so good that the task of selection requires a close and critical examination and an intimate acquaintance with educational methods and needs. Thanks to the conscientious care and professional efficiency of our county and city superintendents and to the honest co-operation of the local boards, there is but little to complain of in this direction.

"But however good the text-books may be, they are but little better than none at all if there be a lack of uniformity in any district. Our reports show an improvement in this respect, but there are still one hundred and thirty-four districts where there is not such uniformity.

"Decided progress is also shown in the increased number of districts that furnish text-books to the pupils. In the previous year there were one hundred and eighty-three such districts; in the past year there were two hundred and forty-four."

The arguments in favor of the free text-book plan, especially in the large cities, are too strong to be neglected, and in no way can the schools be more benefited than by the adoption of free text-books.

LIBRARIES FOR SCHOOLS.

The schools having established libraries now number eight hundred and forty-two; but, during the sixteen years the law for school libraries has been in force, many more should have been established. The appropriations for the past year amounted to \$2,780, which was distributed among two hundred and twenty-four schools. In many districts the libraries have been attended to with much care, and many additions made to them until now they serve a very useful purpose; while in other districts the books have become lost or destroyed, so that a library exists in name only. To make the libraries a success the books should be preserved with great care, and well-selected additions made to them from year to year so that the children would take an interest in them.

EVENING SCHOOLS.

Evening schools were held in eleven cities and were attended by 7,956 pupils, an increase of 632 pupils over the attendance of the previous winter. The average term of the schools was twelve weeks, and the number of instructors was 191 at an average weekly compensation of \$7.17.

NEW LEGISLATION.

Legal holidays.—By act of April 8, 1887, the following are made legal holidays: February 22, Decoration Day, Labor Day (first Monday in September), and any day on which a general election is held for members of Assembly.

Unexpended school funds.—Any balances of the State appropriation remaining in the hands of the township collectors at the close of the school year may be re-apportioned by the county superintendent among the districts of the county.

NEW MEXICO.

[From the Report of the Governor, October 10, 1888.]

"The educational interest of the Territory has not been neglected. Though there has not been that advance that was hoped, yet substantial progress has been made. A compulsory school law was passed at the last session of the Legislature, but its defects were such that it has been practically inoperative, yet it was a step in the right direction, and whatever effect it has had has been good.

"On the whole, the school attendance has been increased, larger amounts of money have been expended in the maintenance of public schools, the number of these schools has increased, as has also the number of denominational and parochial schools and the attendance thereon. The schools of the Territory generally are in perceptibly better condition, and an increased and increasing public interest in the education of the youth is very manifest."

As many of the lands set apart by Congress for school purposes are very desirably located, they are constantly appreciating in value, and some of them are already quite valuable, so that if leased they should serve to augment the school funds to a very considerable extent.

"The persistent efforts to the education of the Navajo and other Indian children are beginning to show good results. All the Indian schools are well attended, and the children are being satisfactorily inducted into the ways of civilized life and in the establishment of habits and education that can not but have a beneficial effect upon their surroundings as they return to their homes, young men and women to dominate by numbers and educated habits of life their several localities. The establishment of these schools in accessible relation to the relatives of the pupils was a wise and thoughtful measure."

NEW YORK.

UNIFORM EXAMINATIONS.

Through the exertions of Superintendent Draper a bill providing for uniform examinations of teachers throughout the State was passed by the Legislature, but it was vetoed by the Governor; nothing daunted, however, he provided sets of questions for examinations which were to be held on the same day, and appealed to the school commissioners to use them and thus secure uniformity without legislative compulsion, and in July, 1888, he was able to announce that all the school commissioners had adopted the plan.

[From Report for 1887-88 of State Superintendent Andrew S. Draper.]

GENERAL STATEMENTS.

"It may properly be said that the year has been one of marked educational activity. The department has had its hands more than full, while superintendents in the cities, commissioners in the country, and the great body of trustees and teachers everywhere have been industriously at work. It is more than doubtful if any other year in the history of the State has witnessed so much of interest, so much of effort, and, it may be added, so much of accomplishment on the part of all grades and classes of educational workers as the one which has just closed. While I have frequently said, and now repeat, that we have no such perfect school system as the present and prospective circumstances of our imperial State require, it must also be said that this fact is attributable to difficulties inherent in the organization and framework of the system, to a lack of comprehensiveness, completeness, symmetry, and practical effectiveness in the machinery of the system, rather than to lack of interest or of inclination on the part of the great body of those charged with the duty of administering it. Officers and teachers have, with rare exceptions, attended the conventions, associations, and institutes of the year; they have cordially supported all measures for improvement; they have cheerfully responded to all calls upon their time and effort, and in a thousand ways and upon innumerable occasions have manifested their strong desire for the substantial and intelligent advancement of the work, as well as their readiness to do whatever it was possible for them to do to accomplish it."

"The criticisms of the public schools which have appeared with frequency in the literary magazines, whether reasonable or not, just or unjust, have drawn the attention of educators and pointed out the necessity of perfecting a public school establishment which would be above legitimate criticism. This has inspired much thought and frequent conference with a view to a clearer understanding of the exact work which the public schools ought to undertake, as well as to bring about such an adjustment of machinery as will bring the different parts into harmonious action, economize labor and cost, and insure general results in the most satisfactory and effectual way."

"In short, on every side a new and healthful interest in public school work on the part of those charged with the carrying on of that work is apparent. That interest is active, substantial, wide-spread, and conscientious. It is already exerting a perceptible influence upon the schools, and I am confident it will not be long before it will be much more strongly felt."

ATTENDANCE.

The statistics with reference to attendance at school furnish occasion "both for some satisfaction and considerable solicitude. They show that the school work of the State has grown somewhat in substantial character during the last thirty years, but that there is comparatively a smaller attendance upon the schools than formerly." Since 1861 there has been a remarkable increase of 135 per cent. in the school population of cities, but in the towns there has been an actual decrease of 15 per cent. Both the total number of children attending schools and the average daily attendance have gradually increased, but the per cent. of the whole number of children of school age in attendance upon schools has as uniformly decreased. In 1851 the per cent. of school population in attendance upon schools was 75.6; in 1861 it had fallen to 65.2; in 1871 to 68.4; in 1881 to 61.4; and in 1888 it was 53.2, smaller than in any previous year.

COMPULSORY ATTENDANCE.

This decrease in the proportion of children attending school was found to be so continuous and uniform that it was thought by school officers and others cognizant of it that inactivity would no longer be justifiable. Accordingly, after much investigation and labor a bill was prepared by a committee of city superintendents, and presented in the Assembly where it received a favorable report from the committee on education, but it failed to become a law. The failure of the Legislature to pass the bill will not, however, deter the friends of education from further efforts, as it is recognized by all that the present law is inoperative, indefinite, and without adequate provision for its enforcement. The State superintendent was anxious to obtain all information possible as to the best methods of securing full attendance at school, and so he addressed letters to the American ministers at London, Paris, and Berlin, making inquiries as to the methods of education adopted in those countries, and in all of them it was found that the children were required to attend school, and indigent children were furnished with clothing, and meals in the middle of the day.

TEACHERS.

Of the 31,726 teachers in the public schools during the year, the number reported as having been employed for a continuous term of twenty-eight weeks or more was 23,052. A circumstance much to be regretted in connection with the public schools is the frequent changing of teachers. During the past year efforts were made to ascertain the number of terms each teacher had taught in the same district, and of the 10,631 districts reporting this item, in more than one-half of them the teachers had taught the same school but a single term, and in more than four-fifths of them the same teacher had not been employed longer than a single term.

"Worthy teachers, practically without power to protect themselves, and deserving nothing but regard and help from the public, are made the foot-ball of school district politics or family feuds, or are persecuted through the petty spite ordinarily aroused in narrow-minded parents by any efficient discipline in the school. There are, moreover, trustees who seem to think that they are chosen to be dictators and a law unto themselves, rather than the administrators of a great system organized and governed by law, and who put their misconceived notions into effect, and, as the most convenient means of showing their authority, gratify their self-importance principally at the expense and discomfiture of the teacher.

"It is incumbent upon the State to see that only persons of unquestioned moral character, of aptitude for the work, and of ample qualifications, shall be permitted to teach in the schools, and it is endeavoring to do this with thoroughness, in ways to which I shall presently refer. Having secured character and qualifications in a teacher, it is bound to throw around the position such safeguards as will make it tolerable and self-respecting.

"In cities teachers are employed at least for the school year. Very commonly they are employed for an indefinite time, the practical effect of which is continuous service so long as ability to fill the place continues. Any attempt to remove a teacher in the middle of a school year without good reason would be resented by public sentiment, as it ought to be.

"But this is not so in the country; at least it is the exception rather than the rule. There the trustee attempts to employ a teacher 'as long as she suits,' or 'gives satisfaction,' for the very purpose of being able to dismiss her at any moment when some simple incident transpires which is not in accord with his poor ideas, or because he may prefer to give another the place."

TEACHERS' CERTIFICATES.

According to the law of 1875 certificates of the State superintendent can only be issued upon examination. During the thirteen years previous to that time the State superintendent issued two thousand and eighty-eight certificates; during the subsequent thirteen years he issued only three hundred and nineteen. The old certificates are not highly appreciated by either teachers or school officers; the new ones are regarded as of the highest value. These certificates are issued only after a searching examination, and no one is eligible to try this examination until after two years' experience in teaching.

The State superintendent has made arrangements with the superintendents of several States by which the certificates given by the State superintendent or a normal school of one State shall be recognized in the other. The system of uniform commissioners' examinations has been adopted throughout the entire State, and it is giving entire satisfaction. The whole number of candidates examined was 21,156, of whom 645 received first-grade certificates, 6,063 received second-grade certificates, and 9,469 received certificates of the third grade. The third-grade certificates are only valid for six months, and are renewable only once upon examination; the second-grade certificates are valid

for two years, and are renewable only upon examination; the first grade certificates are valid for five years, and are renewable, in the discretion of the commissioner, without examination. Some anxiety was felt as to whether there would be a sufficient number of licensed teachers to supply the schools, but there was little trouble from this cause.

TEACHERS' INSTITUTES AND CLASSES.

The whole number of teachers attending the institutes during the year was 16,214, the average number to each institute being 147. Conductors, school officers, teachers, and patrons all unite in testifying to the successful operation of the institutes, the useful instruction given, and the great benefits received.

In order to increase the number of teachers who had received special professional instruction, the number of graduates of the normal schools not being sufficient to supply the schools, provision has been made by the State for a number of years for teachers' classes in academies and union schools. These classes are under the management of the board of regents of the university. During the past year there were 195 of these classes, in which 3,258 students received instruction for ten weeks or more, at a cost to the State of \$33,091. These classes have hitherto failed to accomplish the work desired and expected. They should be reorganized and should have a much longer term than ten weeks. At a conference of the academic principals a resolution was adopted that, in order to increase the efficiency and usefulness of the teachers' classes, they should be placed under the management of the department of public instruction, as they would then be in closer relation with the other agencies for the instruction of teachers.

INDUSTRIAL AND FREE-HAND DRAWING.

There can be no doubt as to the advantages to be derived from manual training both in an educational and utilitarian view. As to whether the incongruous and irrelevant work advocated by some should be incorporated in the regular school work, however, is an entirely different question. The training of the eye and hand can be most fully and advantageously accomplished by thorough training in free-hand and industrial drawing, not simply drawing from copies, but from actual models. Strong efforts have been made during the past year to secure full compliance with the law requiring free instruction in this department to be given in cities and union free school districts. In some places the law was not complied with. Special attention has been given this subject in the teachers' institutes, and, after a little more time for preparation and improvement, it should be included in the examination of teachers.

LIBRARIES.

New York was the first State to begin the establishment of libraries in connection with schools. From 1839 to the present time an annual appropriation of either fifty or fifty-five thousand dollars has been made for libraries, but good libraries are not yet generally established. In 1853 the number of volumes reported in district libraries was 1,604,210; since that time, although the appropriation has been continued regularly, the number of volumes has regularly decreased until in 1887 the number of volumes was 737,716. The most of these are in the cities and large towns where there are other libraries, and where they are consequently not needed so much as in the isolated rural districts. There are many ways in which to account for these failures. The selection of books was left to the district trustees, who were frequently incompetent to discharge the task properly, book-cases were not provided and the books were not carefully looked after, and in many cases, especially where the amount was small, the money was diverted to other purposes.

Inquiries were sent out during the past year to many men prominently identified with the interests of the State, and to many librarians, asking their opinion as to the advisability of continuing the district libraries and, if continued, how best to improve them. They were almost unanimously of the opinion that the libraries should be continued and enlarged.

The libraries at first established were intended to be public libraries, and the management of them simply was intrusted to the teachers.

SCHOOL-HOUSE DESIGNS.

According to the authority granted by the Legislature in 1887, a number of designs for school-houses of low cost were obtained from different architects, and have been published, and received general commendation. The designs were accompanied with suggestions relative to school grounds, ventilation, lighting, heating, etc. Many applications have been received from all parts of the country for specifications and estimates necessary for the construction of the buildings. The designs serve the double purpose of emphasizing the importance of artistic and well-adapted buildings, and of securing their erection at the least cost.

OUT-BUILDINGS.

"Strenuous efforts have been made during the year to secure the general execution of chapter 538 of the laws of 1887, which provides that each school building shall have water-closet accommodations for each sex, and entirely separated each from the other, and which shall be of suitable character and kept in proper condition."

"The result has been a very general compliance with the statute, and an overhauling of school out-buildings such as the State never before witnessed. Still, there are some slow districts. School commissioners have been required to certify that all districts in their territory have complied with the law, or to specify the ones which have failed to do so, and their reports show a few which have neglected the matter."

There should be a sanitary inspector of public school buildings whose duty it should be to see that all public school property was kept in a condition of healthfulness and comfort.

SCHOOL MEETINGS.

The time of the annual school meetings is the second Tuesday in August, and the schools usually begin in the first or second week of September. This does not afford a sufficient interval for trustees to get the buildings in proper order, and for the employment of teachers. It frequently happens, too, that teachers expect to teach in the same school but by a change of trustees they are thrown out of employment and have not sufficient time to make proper arrangements for the next term. The school meeting should be held at least a month earlier.

INDIAN SCHOOLS.

There are 1,546 Indian children of school age in the different reservations in the State. There are thirty schools for them, and the number of children enrolled last year was 1,032; the average daily attendance 420. The average duration of the schools was thirty-six weeks.

Great care has been exercised in the management of these schools; good teachers have been employed, new school-houses erected, and old ones repaired, so that the general equipment of the schools has been better than that of most of the ordinary rural schools.

ARBOR DAY.

According to the laws of 1883 the Friday following the first day of May in each year shall be Arbor Day. Programmes of suitable exercises for the occasion will be issued, and it is hoped there will be a general observance of the day so that encouragement may be given to the planting and preservation of trees and shrubs.

PEDAGOGICS IN COLLEGES.

Quite a number of graduates of colleges become teachers, and it would be well if more of them did so. In a few colleges provision is made for regular instruction in pedagogics. It is thought that it would prove highly satisfactory to teachers and a large portion of the students if the department of public instruction were authorized to furnish courses of lectures for two or three weeks annually on education, school management, and school methods in the different colleges desiring them.

APPORTIONMENT OF PUBLIC MONEYS.

Hitherto the money supplied by the State superintendent to the counties, in addition to the district quotas, has been apportioned as follows: One-half according to the school population, the other half according to the average daily attendance. But, as the average daily attendance was higher where the terms were shortest, those counties which maintained schools for the minimum term of twenty-eight weeks received most money.

The Legislature of 1887 changed this so that the aggregate number of days' attendance should take the place of average daily attendance in the apportionment of funds.

It is recommended by the State superintendent that the minimum school term be made thirty-two weeks instead of twenty-eight.

NEW LEGISLATION.

A memorandum of the contract to be given each teacher.—An act passed by the Legislature May 16, 1887, requires that there shall be delivered to each person employed as a teacher in a public school a memorandum of "the details of the agreement between the parties, and particularly the length of the term of employment, the amount of compensation, and the time or times when such compensation shall be due and payable," and it is required that the pay shall be due "at least as often as the end of each calendar month of the term of employment."

In relation to water-closets.—"The board of education, or the trustee or trustees having supervision over any school district of this State, shall provide suitable and convenient

water-closets or privies for each of the schools under their charge, at least two in number, which shall be entirely separated each from the other and having separate means of access, and the approaches thereto shall be separated by a substantial close fence not less than seven feet in height. It shall be the duty of the officers aforesaid to keep the same in a clean and wholesome condition and a failure to comply with the provisions of this act on the part of the trustees shall be sufficient grounds for removal from office, and for withholding from the district any share of the public moneys of the State."

Evening schools for free instruction in industrial drawing.—Authority is given the school officers "to establish and maintain evening schools for free instruction in industrial drawing, whenever the city authorities in any city or the qualified electors duly convened in any union free school district shall so direct, and shall make provision for the maintenance of such schools. In addition to the powers now conferred by law upon the authorities of any city, or upon the electors of any union free school district in the State, such authorities and such electors shall also have power, whenever they shall think it advisable, to raise such moneys as shall be necessary to carry out the purposes of this act."

The following laws and amendments to laws were passed by the Legislature of 1888:

Teachers' certificates may be granted certain persons without an examination.—The State superintendent of education may, in his discretion, issue a certificate without examination to any graduate of a college or university, who has had three years' experience as a teacher, such certificate to be known as a "college graduate's certificate," and may be revoked at any time for cause. He may also, in his discretion, indorse a diploma issued by a State superintendent or a State board of education of any other State, which indorsement shall render them equivalent to like diplomas and certificates granted in the State of New York. He may also issue temporary licenses to teach, limited to any school commissioner district or school district, and for a period not exceeding six months.

School commissioners may make repairs or additions to school furniture.—The law relating to the powers of school commissioner was so amended that he may direct the trustee to make any repairs or additions to school furniture deemed necessary, provided the expense shall not in any one year exceed one hundred dollars.

School commissioners may issue subpoenas to compel attendance of witnesses.—When directed by the superintendent of public instruction the school commissioner may issue subpoenas to compel the attendance of witnesses, and upon failure to attend the delinquent may be fined by the county judge twenty-five dollars, and in case such penalty is not paid, he may be committed to jail for twenty-five days.

Town clerks to distribute books.—It was made the duty of the town clerk to distribute to the trustees of the school districts and separate neighborhoods all books forwarded to him by the State superintendent or school commissioner for that purpose.

Site not to be changed without the consent of the school commissioner.—The law relating to changing the site of school-houses was amended so as to require the written consent of the school commissioner having jurisdiction before such change can be made.

School commissioner to appoint trustee to fill vacancy.—In case a vacancy in the office of school trustee is not filled in one month's time the school commissioner of the commissioner district may appoint some competent person to fill it, and shall file the appointment in the office of the district clerk; he may also accept the resignation of any school district officer. When a vacancy occurs in the board of trustees of a union school district, and the board makes no provision for filling it and no election is ordered for that purpose, it may be filled by the school commissioner having jurisdiction. But the superintendent of public instruction may order a special election to fill such vacancy.

No order or draft to be given unless there is money to meet it.—It is made a misdemeanor, punishable as such, for a trustee to give an order or draft upon a supervisor or collector unless such officer shall at the time have sufficient funds to meet the obligation.

Union free school districts may issue bonds for making additions to school-houses.—The law relating to the issuing of bonds by union free school districts was so amended that bonds may be issued for securing money to make additions, alterations, or improvements to buildings or structures belonging to the district.

Salary of deputy superintendent.—The salary of the deputy superintendent was fixed at four thousand dollars per annum.

Arbor Day established.—The Friday following the first day of May in each year was made Arbor Day, and it is made the duty of the school authorities of each school in the State to assemble the pupils upon that day in the school building or elsewhere, and to provide for and conduct such exercises as shall tend to encourage the planting, protecting, and preserving of trees and shrubs, and an acquaintance with the best methods to be adopted to accomplish such results. The State superintendent is authorized to prescribe a course of exercises and instruction in such subjects to be observed on that day.

Industrial training provided for.—Boards or departments of education of cities and villages

and of union free schools and trustees of public school districts are authorized to establish departments in their schools for teaching and illustrating the manual or industrial arts, and to establish and maintain such shops as may be necessary for this purpose whenever the authorities now authorized by law to raise money by taxation for school purposes shall make provision for such departments, which they are now authorized to do. The State normal and training schools are required to include in their courses of instruction the principles underlying the manual or industrial arts, and also practical training in the same to such extent as the State superintendent may direct, and to such further extent as the local boards of such schools may direct.

NORTH CAROLINA.

[From Report for 1886-87 and 1887-88 of State Superintendent S. M. Finger.]

GENERAL STATEMENTS.

The statistical returns show that there has been a slight increase in school population, enrolment, and attendance. During the last four years the number of white children has increased 13.2 per cent., while the colored children increased 11.2 per cent. The increase in enrolment and average attendance of white children was a little greater than that of colored children. It is frequently stated that the colored children attend the public schools better than the white children, but the returns show that it is untrue. Besides, a large number of white children attend private schools. It should not be inferred from the fact that only 58 per cent. of the children are enrolled that the remaining 42 per cent. never attend school at all. Many of those not enrolled have already attended school, perhaps for several years, others will attend afterwards, while others still are attending private schools or colleges. The schools have enrolled a larger per cent. of the total population of the State than we find enrolled in several of the States where the public schools have been placed in a very prosperous condition.

While some improvement has been made in the condition of the school-houses, a large number of them are unfit for use, and, in many cases, it is with risk to the health of the children that they are used.

One of the worst features of the public schools of the State is the short length of time they are in operation, the terms varying from two to four months, the average being only about twelve weeks. It is, of course, impossible for the schools to accomplish much in such short terms. When it is considered that several other Southern States, situated in the same way and laboring under the same difficulties, have much longer school terms, it would seem that the people of the State are not doing all they can towards the improvement of the public schools.

TEACHERS.

There are many teachers throughout the State who are yet only school-boys and school-girls, without a sufficient knowledge of the studies they must teach, and especially without a knowledge of the best methods of imparting instruction and of governing a school. It is a very prevalent idea that it is only necessary for a person to understand the different text-books in order to make a successful teacher, but very great changes have been made in the methods of teaching, and as the public schools are permanent institutions, and those who become teachers in them are likely to remain so for several years, it is desirable that they acquire at first the knowledge which has been obtained by others after years of experience. The superintendent thinks that it would be well if some instruction as to the methods of teaching were given in the State University and the different colleges, but that a regular training school for white teachers should be established, eight thousand dollars per annum already being given to the normal schools of the colored people. The training school should be so conducted that the professors would have time to hold county institutes for two or three months in each year.

COUNTY SUPERINTENDENTS.

It is urged that there are very strong reasons why the county superintendents of schools should be made treasurers of the boards of education, and so handle all of the school money, instead of it being done by the county treasurers as is now the case. At present the county superintendent is paid from two to three dollars per day for the work done, while the county treasurer gets a larger amount for simply handling the money, which is a manifest injustice. Under the system before the War the county superintendent was paid two and one-half per cent. for managing the school funds, and if he visited the schools he was paid an additional amount. The expense of the school management then was about the same as at present, but the superintendent got the benefit of it all, and so, as the remuneration was greater, better men could be obtained as superintendents. There is much greater need of competent superintendents now than

then, as there is much more work for them to do, and much greater need of supervision. While examinations serve as a primary test of the competency of teachers, the ultimate test can only be made in the school-room, and should be made by the superintendent, and the teacher graded accordingly. It is highly important that such legislation be made as will transfer the management of the school funds to the county superintendents, and if done the commission for its management may be reduced from three to two per cent., which will save a considerable amount. It would add very much to the convenience of teachers, committeemen, and others, and would secure to the State superintendent prompt reports of the receipts and disbursements of funds—something which he has not been able to obtain from county treasurers.

SCHOOL FUNDS.

The chief cause of inferior school-houses and insufficient teachers is the want of sufficient funds. While the amount spent for school purposes throughout the United States was about two dollars per capita of the total population, in North Carolina it was only thirty-nine cents per capita. The Constitution of the State requires the General Assembly to provide for the maintenance of a system of public schools by taxation and otherwise, and it is a mistake to suppose that measures for this purpose will be unfavorably received by the people. It is true that the people of the State are poor and should be taxed as little as possible, but on account of this poverty the public schools are a greater necessity, in order that the children may be educated at home.

MANUAL TRAINING AND INDUSTRIAL EDUCATION.

In this respect the boys and girls in the rural districts have an advantage over those in the cities, for the work that a farmer boy has to do—sharpening plows, repairing machinery, making hoe-handles, ax-handles, etc.—requires him to reason, think, and observe. The girls, too, find abundant work in the field and house to keep both brains and hands busy, and to secure mental and physical development. Three-fourths of the people of the State are agriculturists, and, as soon as it can be done advisably, some instruction should be given in the public schools as to the elementary principles of agriculture.

OPPOSITION TO PUBLIC SCHOOLS.

Superintendent Finger states that it is needless to disguise the fact that there is strong opposition in North Carolina to the public school system. This arises in the first place from the sentiment that it is wrong to tax one man to educate the children of another. Those who hold to such opinions consider the education given by the public as a *charity*, just as when food is given to those suffering from want. But this was not the principle upon which State education was founded. It was thought necessary that the people be educated in order that they might properly discharge their duties as citizens, and secure the safety of the established institutions; and it was recognized that the material progress and prosperity of the people depended to a large extent upon their intelligence; proofs of which can be easily found in our own country.

Another cause of antagonism to the public schools is the heavy burden of taxation cast upon the impoverished white people of the State who pay nearly all the taxes which go to support the schools of both whites and colored. This antagonism is intensified by the prevalent opinion that education spoils the negro as a laborer. It is estimated, too, that from fifteen to twenty thousand negroes do not list themselves for taxation, and a large portion of those listed fail to pay the tax, so that in these two ways there is a loss to the school fund of about seventy-five thousand dollars, besides a loss to the poor fund of twenty-five thousand dollars.

PRIVATE SCHOOLS.

Although it was impossible to get full information as to the private schools and colleges of the State, the statistics are sufficient to show that this is a very important item and becoming more so every year. About twenty-five thousand of the young people of the State are attending them. It is a matter of congratulation that the efforts made to raise endowments for the different colleges of the State have been so successful, but efforts should be made to establish institutions for the young women also.

RECOMMENDATIONS.

The following recommendations were made to the Legislature: That the law be so amended as to require the condemnation of houses unfit for use and the construction of better ones.

The establishment of a thorough system of county institutes and examination of teachers, and that all teachers be required to attend the institutes.

The establishment for the whites of a teachers' training-school, and an appropriation for this purpose and for the county institutes of \$10,000 per annum.

The abolition of the present summer normal schools.

If the financial condition of the people will bear it, an additional annual appropriation by the General Assembly, to be distributed to such districts as will supplement by private subscriptions their school fund, and to such towns, townships, and cities as supplemented their funds by special taxes.

More active supervision by county superintendents and better pay for them.

Severe penalties upon all officers who have anything to do with levying, collecting, or disbursing school funds if they fail to perform their respective duties.

That the county superintendent be made the treasurer of the board of education.

An amendment to the constitution allowing taxation for schools beyond 66 $\frac{2}{3}$ cents on \$100 of property, and \$2 on the poll.

That teachers shall be examined on some work on methods of teaching and school management.

That the fiscal year of schools close June 30 instead of November 30.

OHIO.

For information contained in this report relating to education in Ohio consult the Index. If the State School Report is received in season, an abstract of it will be given at the close of this volume.

OREGON.

[From Report for 1886-87 and 1887-88 of State Superintendent E. B. McElroy.]

In compliance with the laws of Oregon, the superintendent visited many of the schools of the State, and he made close inspection as to the condition of school-buildings as regards ventilation, lighting, and heating, neatness of rooms, the condition of the school grounds, the attendance of pupils, the methods of the teachers, etc.

In some places the school buildings and the care of the school grounds gave strong evidence of enterprise and progress; but in others the very reverse was true—buildings dilapidated, grounds unenclosed, no shade trees, and a general appearance of a want of progress. In the towns and cities the schools were usually in a flourishing condition, good teachers were employed, and the furniture was of the latest and most improved character. The superintendent also visited some of the best schools of Iowa, Missouri, Illinois, Indiana, and Pennsylvania.

PUBLIC EDUCATION.

Schools and higher institutions of learning are established in all parts of the State, so that a free education is offered to every youth, and the avenues to success and honor are open to all. Hundreds of intelligent men and women have been added to the communities, and the benign influences of the schools are found on every side; and as the public schools have now become an established institution, it only remains for the people to strengthen, improve, and elevate them.

DISTRICTS.

The reports of the county superintendents show that in March, 1883, the number of organized school districts in the State was 1,518. Some of these districts were very large, fifteen to twenty-five square miles, while the average size of the districts was about nine square miles. The boundaries of the districts are very irregular, and in some cases the districts are divided by deep ravines or rocky spurs. In some districts which are very large the schools are located near the centre, and some of the children are required to go for miles to school; but in the more populous communities the districts are small, the school-house is within easy reach of all the pupils, and consequently the attendance is more punctual and regular. The board of directors of each district has the authority to locate the school-house, and in all cases it should be done with reference to the convenience of the pupils and the future growth of the community.

SCHOOL CENSUS.

"The annual census made by school clerks in 1887 gives an enrolment of 87,217 persons who drew public school funds. The census completed March 5, 1888, gives an enrolment of 86,574, a decrease in one year of 643. It would appear from this that our State is on the decline rather than advancing. This is not correct. On the contrary, it is well known that, in addition to the natural increase in the State, the immigration from March, 1887, to March, 1888, was large, and, in the major portion of it, permanent. The decrease appearing above, therefore, is not real. The new law controlling the census report was approved February 17, 1887. Prior to that time the methods adopted in making the annual census returns were exceedingly careless and reckless.

"It was not uncommon for children to be enrolled in *two* districts, and in some instances in *three*. The new school law requires each clerk to enroll for school purposes all persons in each district over four and under twenty years of age. This census must contain the names and ages of all children of the school ages mentioned above, and shall also contain the names of all parents and guardians resident in the district. This enumeration is to include all youth who, at the time of taking such enumeration, actually dwell or have their home in the district."

The good results of the new law are already apparent in securing correct and accurate returns. The number of children receiving a *pro rata* share of the public funds is not the result of estimates and exaggeration.

COUNTY SUPERVISION.

In some counties of the State the salary of the county superintendent is so small that the office is a merely nominal one, and no interest is taken in the election of a suitable person. This is a great mistake. A competent and energetic school superintendent would be of great assistance to the schools in introducing new methods, giving directions to teachers, assisting in classifying the pupils, and in many other ways. Especially in a new State like Oregon, where the population is rapidly increasing and many new enterprises are being undertaken, would a county superintendent be of great benefit to the schools.

TEACHERS.

The demand for earnest, progressive teachers is increasing throughout the State, and the teachers already in service are making many improvements, adopting new methods, and qualifying themselves for more efficient service. There is a tendency among some of the directors to employ cheap teachers, and frequently a young, inexperienced teacher is employed because he can be engaged for less money, or because of the importunities of some of his relatives; and in this way the experienced and thoroughly qualified teachers are driven into other businesses or to States where they will be better appreciated.

Teachers, in order to do their work well, should thoroughly understand it, and they should not attempt to cover too much ground, but instead should endeavor to make the children understand fully what is taught.

SCHOOL-HOUSES.

From the reports of the county superintendents it is estimated that the number of school-houses in the State at the close of the year 1888 was about fourteen hundred and fifty, about ninety per cent. being frame buildings, the remainder being of bricks or logs. During the last six years about one hundred buildings, on an average, were erected each year. Many of the school-houses are comfortable and elegant buildings, but others are in a bad condition, and in some cases unfit for use.

In a late edition of the school laws, as well as in the biennial report of the superintendent, plans and directions for village and rural school-buildings were given for the guidance of school officers and patrons. When possible the school-house should be erected in the centre of the district, rather than the centre of population, as the latter is liable to change. It should be situated on a gently rising elevation, and attention should be given to proper lighting, heating, and ventilation; cloak rooms should be provided, and a closet for the safe-keeping of movable articles.

NEW LEGISLATION.

Teachers' examinations and certificates.—The new law relative to teachers' examinations, approved February 21, 1887, is as follows: In each county there shall be a board of examiners, consisting of the county superintendents and two competent persons appointed by the county superintendent, who shall serve one year, and each shall receive three dollars per day for the time actually employed in conducting the quarterly examinations, which shall be held on the last Wednesday of February, May, August, and November of each year.

Certificates shall be of the first, second, and third grade, and shall continue in force for two years, one year, and six months, respectively. Certificates of the first grade shall not be issued to any one under eighteen years of age, nor to any one who has not taught successfully for at least twelve school months, and then only when he or she shall have stood an examination on all the branches required by law, and shall have answered ninety per cent. of all questions asked, falling below seventy per cent. in no branch. Certificates of the first grade may be renewed once upon the payment of a fee of two dollars and fifty cents.

Certificates of the second grade shall not be granted persons under seventeen years of age, and then only when they shall have stood an examination, making an average of eighty per cent. on all branches, falling below sixty per cent. in no branch. Certificates of the third grade shall only be granted those persons who make an average of not less than seventy per cent. on all the branches, falling below forty per cent. in no branch.

RECOMMENDATIONS.

- (1) The schools should be closely inspected by the directors.
- (2) Each school should be supplied with a dictionary and the necessary apparatus.
- (3) The salaries of teachers should be graded according to the experience and grade of certificate held.
- (4) Directors should employ experienced teachers for the primary grades.
- (5) Successful and efficient teachers should be retained and their pay increased.
- (6) A longer and continuous school term should be established.
- (7) A graded course of study should be established in each county.
- (8) County superintendents should devote their entire time to general and local supervision, and should receive adequate salaries.
- (9) Normal institutes should be established in each county.
- (10) Teachers' associations should be established.
- (11) School districts should be required to build wood-sheds and other necessary out-houses for the health and comfort of teachers and pupils.
- (12) Public examinations of the schools should be held at the close of each term by the county superintendent or his deputy, and promotions made and diplomas granted.
- (13) New school districts should be required to establish a school at the expiration of one year after organization.
- (14) School moneys should be apportioned on a basis of the actual total attendance, instead of the total school population between the ages of four and twenty years.
- (15) The rate-bill plan of securing funds should be eliminated from our school system.

PENNSYLVANIA.

[From Report for 1887-88 of State Superintendent E. E. Higbee.]

GENERAL CONDITION.

The year 1887-88 was one of unusual progress in the public schools of Pennsylvania. An advance along the whole line seems to have been made. Although there were two hundred and eighty more schools than in the previous year, yet the school term was longer, being, exclusive of Philadelphia, where the term is ten months, 7.17 months, while in the previous year it was only 6.71. This is to be attributed in great part to the requirement of six months as the minimum school term. It was expected by many that, as a result of lengthening the minimum term, the monthly salaries of teachers would be reduced proportionally, but on the contrary there never has been so large an increase in the money paid to teachers. Large and well-arranged school buildings have been erected in New Castle, Phillipsburg, Braddock, Williamsport, Harrisburg, Bedford, Kittanning, and elsewhere. Many libraries have been organized and others enlarged. Freehand and mechanical drawing have been introduced in many of the schools.

SCHOOL CENSUS.

The number of pupils now enrolled in the public schools, exclusive of those in Philadelphia, is 831,367; an increase over the previous year of 10,556. After making all due allowance for those who attend private schools, this still leaves a large number of children of school age who attend no school. As no yearly enumeration of the children is made, it is impossible to determine definitely the number of those who do not attend any school. It is therefore recommended that it be made the duty of the district directors to make an annual enumeration of the children in their districts, so that the number not attending school can be ascertained and steps taken to secure their attendance.

SUPERVISION.

"No one at all acquainted with educational work can fail to recognize the necessity of close inspection. In our city schools, where generally the interests of education are well advanced, and great pride is taken in its success, careful inspection is, in most cases, secured. Professional educators, of superior attainments and skill, are employed, with such remuneration as their high standing demands. But in our rural districts and smaller villages, where an inspection of kindred character is perhaps even more needed, this important matter has been too much and too long neglected.

"Our county superintendents have done a great work since 1854, but their fields of administration are so large as to render any close inspection upon their part impossible. They need help. Their own work, to be made thorough and efficient, must be supplemented by the aid of assistant district superintendents. How can one man attend to the general matters of county school administration and at the same time carefully inspect from two to four hundred schools in districts scattered over the whole area of a county? It is simply impossible."

MANUAL TRAINING AND INDUSTRIAL EDUCATION.

Superintendent Higbee thinks that the sphere of the public schools embraces more than the ordinary studies—arithmetic, history, geography, writing, drawing, etc.—and that a certain amount of manual training and industrial education should be included; that the girls should be taught “household economy, embracing the nature and kinds of marketable foods, with the proper methods of their preservation and of their preparation for the table; a knowledge of textile fabrics and their construction into garments and decorations, the handling of the needle and sewing-machine, and information and practice referring to all that must ordinarily challenge a prudent and intelligent housewife;” that the boys should be instructed as to the “different kinds of soil and their value for agriculture, and the proper treatment of the same; the different varieties of timber which our forests yield and the methods of their preparation for market; the handling of the ordinary tools which workers in wood and metals use, and the keeping of them in proper repair.” He does not wish to be understood to say, however, that the schools should teach trades, turning out boys as printers, carpenters, shoemakers, etc.

In the cities and larger towns manual training and industrial schools should be established, where those desiring to do so could pursue the course still further. Polytechnic instruction, also, should be introduced.

The Legislature, at its session in 1887, adopted the following resolution:

“Resolved, That the Governor is hereby authorized and requested to appoint a commission consisting of not more than five persons, citizens of this Commonwealth, to make inquiry and report to the Legislature at its next session, by bill or otherwise, respecting the subject of industrial education, including an examination of the extent to which it is already carried on in Pennsylvania and elsewhere, the best means of promoting and maintaining it in its several grades, whether by State or local action alone, or by both combined; how far it is possible or desirable to incorporate it into the existing system of public instruction, the best method of training teachers for such schools or departments, and what changes, if any, are required in the existing system of normal schools to enable them to provide such training or to meet more fully the needs of the system of public instruction as now organized in this State, with such other inquiries as the commission may itself institute or be requested by the Governor to undertake. The members of the commission shall serve without compensation, except for necessary expenses and clerk-hire actually incurred and approved by the Governor.”

PHYSIOLOGY AND HYGIENE.

The introduction of the study of physiology and hygiene has been attended with no difficulties, but has met with much favor from both teachers and pupils. The instruction has been given mainly as a *science*, with special reference to the physical evils, little attention being given to the moral side of the question. In order to strengthen pupils in their determination to avoid the physical evils consequent upon intemperance, they should be instructed as to its moral and social evils also.

FREE TEXT-BOOKS.

School directors are authorized by law to furnish free text-books to their schools, if they see fit; and this authority is being exercised more and more every year, not only in the cities but in the rural districts, as well; and it invariably gives general satisfaction. It is found to be more economical; it saves much time at the opening of schools, on account of pupils being supplied with books at once, and it secures a much larger attendance, as parents with large families are no longer frightened by thoughts of a long bill for school-books and stationery.

RHODE ISLAND.

[From Report for 1887-88 of State Superintendent Thomas B. Stockwell.]

GENERAL STATEMENTS.

The schools of Rhode Island are reported to be in a prosperous condition, well attended, taught by an unusually well qualified corps of teachers, and giving general satisfaction. Much interest in the practical questions of the schools is being manifested by the people, and a strong desire shown for their continued and increased prosperity.

There has been an unusually large increase in the number of graded schools, but the small district schools are gradually disappearing. The average length of the schools of the State is nine months and eleven days, an increase of one day over last year, which may be attributed to the increase in the number of graded schools, all of which have a session of forty weeks.

ATTENDANCE.

The percentage of attendance at all schools to the whole school population is 78.6, a decrease of 2.7 per cent. from last year. There were 4,667 children between the ages of seven and fifteen who did not attend any school, an increase of 436 over last year. The increase in the average number belonging and in the average attendance did not correspond to the increase in the number of pupils enrolled. This is accounted for, to some extent, by the children being kept at home during the prevalence of scarlet fever, diphtheria, or other contagious diseases; the enforcement of the law requiring the attendance of children at school for twelve weeks also tends to diminish the average attendance for the year of the number of pupils enrolled, many of them leaving school as soon as the compulsory term has expired.

When we consider the large amount of money spent upon the public schools of the State, and the efforts made to render them attractive and profitable, it is greatly to be regretted that, on account of the indifference of parents and the selfishness of employers, so many children do not avail themselves of their great opportunities. The truant law should therefore be more rigidly enforced, and the children should be required to attend twenty weeks instead of twelve. "In the forty weeks spent in the workshops, children forget what they have learned and go back to school to begin over again the lessons of the year before. Discouraged, listless, old before their time, they grow up to manhood and womanhood with no adequate conception of their life's work." It is thought that if the appointment of truant officers was made by the State board of education or some central authority, instead of being given as a reward for party service as at present, the law would be more strictly enforced.

TEACHERS.

The total number of teachers employed was 1,333, of whom only 170 were males. The number of male teachers is growing gradually less, a fact much to be regretted and avoided if possible, not because men are necessarily better teachers than women, but because both sexes should be employed, each having characteristics not possessed by the other. The two types of mind and heart are distinct and were designed to have their combined effect on the youthful character. Any scheme of education and training that leaves out either is defective and can not secure that symmetrical development which is possible under the other plan.

There was an increased number of teachers who had received their education at colleges and universities and particularly at the normal school. This indicates that the teachers were better qualified to discharge their work successfully and satisfactorily. One serious obstacle to effective work, however, is the frequent change of teachers, one-fourth of the whole number holding new positions. The most of these changes were in the small schools, where the qualifications of teachers are not accurately determined.

FINANCES.

The total amount raised for schools was \$930,840.25, an increase over the previous year of \$26,615.09. By the late amendment to the Constitution of the State the registry tax is abolished. The income from this source last year was \$19,773.15, and the school funds hereafter will be about that much less than heretofore, unless provision is made for supplying the deficiency.

In reckoning the cost of instruction some interesting facts appear. Though we have paid some \$13,000 more for teachers' wages than last year, we have reduced the cost on the enrolment 37 cents per head, and on the average attendance 19 cents, while a single month's instruction for each pupil remains the same as last year.

EVENING SCHOOLS.

These have succeeded well and have accomplished much good for many who from different causes failed to secure an education during their childhood. It was mainly for such persons as these that evening schools were established, and they should not be opened to those who have the opportunity of attending the day schools. The evening schools of the last year had shorter terms and older pupils than formerly. Their success should not be estimated by the number of pupils attending them, for in many cases a large number of pupils is the cause of failure. Evening schools have succeeded best in those places where they have been longest established, especially where provision has been made for meeting the wants of older pupils, such as instruction in book-keeping, mechanical drawing, etc. The cost of evening schools is somewhat greater than that of day schools, but it should be remembered that *night work* in any business or trade costs more than similar work done in the day.

HIGH SCHOOLS.

There are now ten high schools established in as many different towns, besides two that are supported by tuition. Three of these have been lately established, and another town has erected a building for a high school and will soon have it in operation. This shows that the people are no longer content with a knowledge of the three "R's" simply, or even with the curriculum of the modern grammar school.

In addition to the direct benefits that arise from the establishment of a high school, there are some indirect advantages. As the teachers of a town are usually selected from its residents, by advancing the standard of education in a town there results the employment of more highly educated teachers. It establishes, too, a higher mark or degree of attainment to which pupils will aspire before finally quitting school.

The establishment and successful maintenance of a high school by the small town of Barrington, which has only five district schools to rely upon for its high-school pupils, shows that high schools might easily be established in many other places where they are not found, and where the children are deprived of all higher education.

PRIVATE SCHOOLS.

During the last few years many private schools have been established, and in some of the large manufacturing towns the enrolment of the private schools rivals that of the public schools. As to what is taught in them, how much and how well, it is difficult to say. The State board of education thinks that a list of studies should be prescribed for all schools in the State, both public and private, and that supervisors should be appointed to visit and report upon them.

FREE PUBLIC LIBRARIES.

There are now thirty-eight free libraries in the State, containing 144,269 volumes. It is estimated that eighty per cent. of the population are in reach of a library, and when a few more shall have been established the State will be able to claim the distinction which possibly no other can claim, that free schools and free libraries have been placed within the reach of the entire population. The public libraries serve the very important purpose of harmonizing and unifying the heterogeneous mass of people gathered into the State.

POLITICAL FUNCTION OF THE SCHOOLS.

One of the prime objects in the establishment of the public schools is the preservation of a republican form by government by educating the masses of the people and thereby enabling them fully to understand their rights and to maintain them. To assist in this, the pupils should be thoroughly instructed as to the American system of government, as to American statesmen, inventors, generals, and other celebrated men, so that, although their parents may continue to cherish the fondest affection for their native land, the children shall be fully imbued with the ideas and sentiments of this country.

SCIENCE AND INDUSTRIAL TRAINING.

The State board of education claims that industrial training must be given a place in the public schools, not that it should supplant anything, but that it should be made supplementary to the regular course. This kind of instruction is particularly needed now, since apprenticeships are no longer in vogue.

The State superintendent thinks that this want can be met to a large extent by giving instruction in the natural and physical sciences. "In the upper grades of our grammar schools and in the high schools, if physics were taught experimentally, the pupil would acquire from a thorough course in that study all that aptitude for handling tools, that acquaintance with the nature and uses of different kinds of materials, that opportunity for the development of whatever latent inventive genius there may be, which are claimed to be the real benefits to be secured from manual training."

Geology, mineralogy, botany, and zoölogy are already included in the course, and it is only necessary to modify the methods of instruction in them to meet, to a large extent, the demands for manual instruction.

RECOMMENDATIONS.

The State superintendent thinks that the time has come when the district system of conducting the schools should be abolished, and he cites a number of disadvantages arising from it: such as, placing the expenditure of a large amount of money in the hands of a scattered body of persons whose principal aim sometimes is "to use up the money;" frequently the poorest teacher of a town is paid more than the best; a school is sometimes closed for months because of the wilfulness of a trustee who can not secure the appointment of the teacher whom he desires, or because the school building is no longer fit for occupancy and the voters refuse to make the necessary improvements.

It is also recommended that a minimum standard of qualifications should be required of all teachers. At present no standard whatever is established, but it is left to each town committee to determine for itself what attainments shall be required. In some towns the teacher is required to be thoroughly qualified, while in others the committee is satisfied with recommendations and promises. It is not recommended that the State determine the degree of education exacted, but that it shall require that every teacher shall at least reach a minimum standard, leaving it to each town committee to say how much higher the standard shall be raised.

ARBOR DAY.

An act was passed by the Legislature in January, 1887, making such day as may be appointed by the Governor "Arbor Day" a holiday.

SOUTH CAROLINA.

[From Report for 1887-88 of State Superintendent James H. Rice.]

GENERAL CONDITION.

The report of the State superintendent for the year 1887-88 acquires additional interest from the fact that it is not founded alone upon reports made to him by the school commissioners of the different counties, but to a large extent upon his personal observation, as he visited during the year every county in the State, met with the teachers and trustees of many districts, and in many towns delivered addresses upon educational subjects.

The public free schools are meeting with more favor each succeeding year, and the people are manifesting their interest in them by their efforts in many ways to improve them. Large and comfortable school buildings have been erected in many towns and local taxes voted to supplement the regular school tax imposed by the State. It is claimed that during the last two years more money has been expended in the erection of good school buildings than in any similar period in the history of the State. Special mention is made of those erected in Greenville, Spartanburg, Winnsborough, and Rock Hill.

The enrolment of pupils shows a large increase; the total number being 193,434, an increase of 18,417 over that of the preceding year. The average attendance also shows a large increase, being 139,557; an increase of 14,036. It is unfortunate that these favorable statements should be offset to some extent by the unfavorable one that the average duration of the public schools was only three and six-tenths months. It should be remembered, however, that in many of the larger towns and prosperous districts the schools are continued for eight or ten months by local taxation or private subscriptions. The State superintendent recommends that the Legislature enact a general law allowing all school districts to levy a local tax to supplement the amount received from the general State fund.

TEXT-BOOKS.

The law requires the State board of examiners every five years to make a selection of text-books to be used in the public schools. Accordingly in September, 1888, the board met and

"Resolved, That the peculiar condition of affairs in this State, by reason of which not only in each county but in each school district there are teachers and pupils of different classes and races possessing different capacities to teach, learn, and purchase books, it would be injurious to educational interest to adopt a single list of text-books for the State."

"In order to secure flexibility in the system and to meet the varying wants of the schools, and at the same time to prevent frequent changes in text-books in a school, which impose vexatious and unnecessary expense upon parents," the board adopted several series of text-books, from which the county boards were allowed to select a single series for their respective counties. Any teacher refusing to use the books adopted forfeited his pay from the public school fund.

SCHOOL COMMISSIONER.

Much prejudice exists against the office of county school commissioner, which can be explained to a large extent by the perfunctory manner in which the officer discharges his duties and by his manifesting a zeal only in collecting his salary. It is thought, however, that to abolish the office would be a fatal mistake, but efforts should be made to increase the efficiency of the office. "The law requires this officer to examine every teacher, and yet it allows any man who can get the votes to fill the office, when, as a matter of

fact, he can not, in many instances, examine a single teacher. This is a blunder and worse than a crime." It is recommended that, after the selection by the voters, the man selected should be required to stand an examination before the State board of examiners, and if he fail to pass a satisfactory examination the office be filled by appointment. It is especially important that the office be filled by one thoroughly competent to superintend the schools of the county, as the people, on account of their poverty, are unable to send their children from home to be educated.

INDUSTRIAL TRAINING.

"There is quite a demand for industrial training schools. These must be built on special foundations or the experiments made by the schools of the larger towns. We can not add such features to our three months' free schools. It is greatly to be desired that private benevolence would furnish at least one model. Our boys and girls would fill such an institution, and soon they would be multiplied."

TENNESSEE.

[From Report for 1886-87 of State Superintendent Frank M. Smith.]

APPRECIATION OF THE PUBLIC SCHOOLS.

There is practically no opposition in the State to the public schools; but, on the contrary, the people appreciate fully the great advantages conferred by them, and are demanding that the school term be lengthened, and that the schools be improved in other ways. The county courts, too, are making more liberal appropriations in behalf of them.

SCHOOL DISTRICTS.

The schools' districts are identical with the civil districts; and, according to the law, no authorities except the county courts have the power to establish new districts; but, by a misunderstanding of the law, school directors have in many instances divided their districts into quite a number of smaller districts. As a consequence there are in some cases as many as two hundred districts where there should not be more than twenty. This tends to greatly weaken the efficiency of the schools, for instead of having two or three schools with several teachers and two or three hundred pupils properly graded into different classes, there are found a number of small schools struggling for a bare existence and in which all the grades are taught.

In order to prevent one school in a district from being overcrowded with pupils while the others have a very small number, the directors are authorized to say which school different pupils shall attend; but all the schools in a district must be maintained the same number of days, and when the public funds are not sufficient to keep up the schools for five months, the county courts shall either levy an additional tax for the purpose or submit the proposition to a vote of the people.

DIRECTORS.

One school director is elected annually on the first Thursday in August, to hold office for a term of three years. If a vacancy occurs at any time the remaining two directors appoint one to serve out the unexpired term.

TEXT-BOOKS.

Only the district directors have the power to adopt a series of text-books, but the directors of a county may meet together and adopt a common series, but their action shall not be binding on the directors of any district who wish to adopt different ones. County superintendents have no authority to adopt text-books for the county.

CONVENTION OF COUNTY SUPERINTENDENTS.

A convention of county superintendents was held in Nashville on the 6th of December, and proved to be a very interesting and important meeting. Subjects pertaining to the educational condition and improvements were considered, and such an interest was manifested in the proceedings that it was resolved to hold an annual meeting in Nashville on the second Tuesday of December, and that all school officers and teachers might become members.

NEW LEGISLATION.

Arbor Day established.—The Legislature, in March, 1887, made it the duty of the county superintendents to set apart annually some day in November as "Arbor Day," when the pupils of each school, under the supervision of the teacher, should set out trees around the school buildings and otherwise improve and beautify the appearance of the grounds,

so that the day should be one of enjoyment to the pupils, as well as of instruction in the importance of this subject.

[From Report for 1887-88 of State Superintendent Frank M. Smith.]

GENERAL STATEMENTS.

The growth of the public school system of Tennessee since 1873, when the present school laws went into effect, has been exceedingly gratifying; the enrolment and average attendance have nearly doubled, and the school-houses and school furniture are now far better. The length of the school term, however, is not much greater.

Teachers' institutes were held during the year in ninety of the ninety-six counties of the State, and were attended by four thousand three hundred and fifty teachers.

SCHOOL DISTRICTS.

Great injury has been done to the cause of education in some of the counties by the formation of a large number of school districts; in some counties there are eighty or ninety districts where there should only be eight or ten. In some of these districts the directors are utterly incompetent to discharge the duties efficiently. In most of the counties the school district and the civil district are identical, and in these counties we find the best schools. It is better to have a few schools attended by a large number of pupils than to have a large number of weak, struggling schools. In some cases the district directors have assumed the authority of forming new districts, an authority which belongs only to the county courts. The directors may determine what school in a district each child shall attend, but they have no authority to establish a new district.

COMMON-SCHOOL DIPLOMAS.

The State superintendent has had prepared a common-school diploma, a transcript of which is to be given each boy or girl who completes the course of studies required by law to be taught in the public schools; viz, orthography, reading, writing, arithmetic, English grammar, geography, United States history, elementary geography of Tennessee, and elementary principles of agriculture. This idea meets with general approbation, and it is thought that it will stimulate both teachers and pupils to more thorough and better work.

GRADED SCHOOLS.

In many counties graded schools have been established; and in the towns of Gallatin, Morristown, and Johnson City boards of education have been elected, corporation taxes imposed, and all the necessary arrangements made for running the schools ten months in the year. In Tracy City there is being erected a good school building, which when completed will be equal to any in the State.

COUNTY SUPERINTENDENTS.

In several counties of the State women were appointed by the county courts to serve as superintendents of schools. The State superintendent decided that according to the Constitution and laws of the State women are not eligible to the office, and in this decision he has been sustained by the attorney-general. The State superintendent called the attention of the county courts to this fact, and also as to the advisability of reappointing men who had shown themselves specially fitted to discharge the duties of county superintendents.

LOCAL TAXATION.

The law requires "that when the money derived from the school fund and taxes imposed by the State on the counties shall not be sufficient to keep up the public schools for five months in the year in the school districts of the county, the county court shall levy an additional tax sufficient for this purpose, or shall submit the proposition to a vote of the people." In several counties these additional taxes were levied. In Dyer County the court raised the tax from fifteen cents to twenty cents on a hundred dollars' worth of taxable property, and so satisfactory were the results that when it became necessary the next year to reduce the rate of taxation the reduction was made in county expenses and not in the school funds.

SCHOOL FUNDS.

The county trustees are required by law to keep the State and county funds entirely distinct, also to keep an account showing from what sources the funds are derived and to whom they are paid. They are also required to report to the county superintendent and to the district directors whenever any funds are received. These requirements are constantly disregarded.

Another evidence of the reckless management of the school funds is the want of correspondence in the balances left over June 30, the close of the fiscal year, and the amounts reported as on hand the next day, July 1.

The superintendent estimates that the schools lose each year at least one hundred thousand dollars by the non-collection of poll taxes which should be collected.

ASSOCIATION OF PUBLIC SCHOOL OFFICERS.

The association met at Nashville December 11, 1888. The session continued for four days, during which time many topics relating to the public schools were considered and plans for their improvement discussed. The superintendent thinks that this annual meeting of school officers will prove of great benefit to the schools, and in order to secure a full attendance of the county superintendents provision for defraying their expenses should be made by the county courts.

TEXAS.

[From Report for 1887-88 of State Superintendent Oscar H. Cooper.]

PUBLIC INSTRUCTION.

The obligation of the State to provide for the proper instruction of its youth in the elementary branches was recognized while Texas formed a part of Mexico, and it was one of the charges brought against that country by those who proclaimed its independence that Mexico had failed to establish a system of public instruction as required by its constitution and for which it possessed eminent resources. It was again recognized in the constitution of the Republic of Texas, and in the successive State constitutions of 1845, 1866, 1869, and 1876. The State now has a fine opportunity to establish one of the best educational systems of any State or Territory in the Union. The interest-bearing fund of the common schools and the State University is already \$20,000,000; the income from which is larger than that from the endowment funds of any other State, and there yet remain unsold thirty million acres of land which will greatly increase the school funds.

"It is the general impression, doubtless well founded, that better work has been done in the schools during the past two years than has ever been done before. This is due chiefly to the general progress of the State in intelligence and wealth, and to the increased interest everywhere manifested in the schools; but the establishment of a standard in the examination of teachers has contributed an important part toward this result."

.There are some defects, however, which mar the beauty of the system very much.

LENGTH OF TERM.

The average school term in the country schools is five months; in the town schools eight months. As these are the average lengths of the terms it follows that quite a number of the schools do not continue so long. All the schools of the State should be open at least six months, as required by the State constitution; but, as the increased income from land sales, leases, etc., will only be sufficient to meet the increase in population, it will be necessary to impose local taxes or to increase the State tax.

LOCAL TAXATION.

"It is the rule throughout the United States that the chief part of the fund used to support the schools of the district is levied, collected, and disbursed in the district. This system makes the people more watchful of the schools and accords closely with our notions of local autonomy."

It is left optional with each district whether it will try local taxes or not, and at present out of the three thousand school districts less than three hundred impose local taxes. It is not to be expected that many districts will vote the tax so long as the present law remains which requires a petition for an election by a certain number of land-holders, as in some parts of the State the number of the latter is quite small. A law should be passed abolishing the "community" system, as it is impossible to hold an election for local taxation where it is in vogue.

TEMPORARY DEFICIENCIES IN SCHOOL FUNDS.

"The most serious criticism made on our present school system is the uncertainty in the time of payment of teachers. Temporary deficiencies in funds to pay teachers are of common occurrence, and become pretty general during certain months of the year. This is the time when the balances carried over from the previous year have been generally exhausted and the collector of taxes has not begun to pay the local treasurers the school taxes collected for the year. The general explanation of these temporary defi-

ciencies is obvious: The schools are taught before the money to pay teachers' salaries has been collected. One way to remedy these deficiencies would be to postpone the opening of the schools for one year, from September to January 1. This should, however, be done only as a last resort, as it would be depriving the children of schools in order that money might accumulate in the State treasury. The other method would be to accumulate about \$500,000 in the treasury at the opening of the scholastic year."

This amount will be accumulated during the year if the overdue interest which has been increasing for more than ten years can be collected. Authority should also be given the State superintendent to withhold approval of requisitions for school moneys from cities and counties not then needing the funds.

SCHOOL-HOUSES.

The number of country schools in operation during the year 1887-88 was 8,826, while the number of school-houses belonging to the school authorities was only 3,286, the remaining schools being taught in church-buildings, barns, etc. "In many counties the value of the common jail exceeds that of all the school property in the county." If a school-house is built with public funds no additional money will be granted that community during the year to pay the salary of a teacher, and as the people are taxed for the benefit of schools they do not feel disposed to build a house at their own expense and then donate it to the public, especially as they may move to some other locality the next year and so get no further benefit from it. The average value of the country school-houses, with sites and furniture, is \$300, while the average value of those in cities is \$8,000. This great difference is explained by the fact that in cities the municipal authorities are allowed to issue bonds to obtain money to erect school-buildings, the bonds being paid gradually, while the county authorities are not permitted to raise money in the same way. It is thought that this authority should be granted the county authorities, as it would also serve as a safe investment for the permanent school fund, would enhance the value of property, and would attract desirable immigrants to the State.

TEACHERS.

The State should provide for a uniform standard for teachers' qualifications by requiring the questions for the examinations to be prepared by the State superintendent. The requirement of written examinations and that boards of examiners shall report under oath has already served to elevate considerably the grade of teachers. As the real success of a teacher can only be determined in the school-room, licenses should at first be only probationary, and, after some experience, might be granted for longer terms, and those persons who show eminent ability and skill should be granted licenses for life.

COUNTY SUPERINTENDENTS.

During the last two years the experiment has been made in several counties of having all the schools of a county placed under one superintendent, and it has proved highly satisfactory in every respect. The school term was usually lengthened, although the amount of funds per capita was less, and the quality of work done was much better. Supervision by the county judges was an entire failure, as not more than one-fourth of the schools were visited by them, and the State superintendent could not thoroughly instruct the thirty thousand trustees as to the school work. "I am clearly of the opinion that it will be found to be wise economy to provide county superintendency in all the organized counties of the State. The quality of the work required of the schools will be greatly improved in most counties, and the school fund will be more effectively used."

TEXT-BOOKS.

The State superintendent issued a circular to the school trustees that it was their duty to adopt a series of text-books for their respective districts and to prohibit the use of others. In some of the counties the trustees held a joint meeting and adopted a uniform system for the whole county. In this way parents can be saved the heavy expense incurred by every change of teacher or residence, and the teacher will be saved a great deal of unnecessary labor. State uniformity of text-books would be better still, if it can be adopted without risk of corruption in the selection of books and the centralization of too much power in the hands of a few. While it would not be advisable to adopt free text-books for the country schools on account of the impossibility of securing proper care in the use of them, it would certainly prove satisfactory in the cities and larger towns.

SCHOOL DISTRICTS.

The plan of having separate districts for each school proves liable to the same objections as the community system, and it is recommended that districts be made large

enough to include quite a number of schools—five to fifteen—the boundaries being determined somewhat by surrounding conditions, creeks, rivers, good roads, etc.

CLASSIFICATION OF SCHOOLS.

The school law requires instruction to be given in the ordinary branches, and such studies as the trustees or State superintendent may direct. This authority is often used by the trustees to the great detriment of the schools, when they allow two or three pupils to be taught in the higher branches and to consume as much time as any large class of the thirty or forty pupils. To avoid this difficulty the schools should be divided into primary, intermediate, and high schools. In the primary schools should be taught spelling, reading, writing, primary arithmetic, history, geography, etc. In the intermediate, these studies should be carried further, so that the pupils could enter the high schools; and in the high schools should be taught such branches as are necessary to admit students to the State university and normal schools, and to enter the ordinary vocations, the course being limited to three years. The great majority of the schools should be of the first kind, one high school to a county being sufficient.

UTAH.

[From Report for 1885-86 and 1886-87 of Commissioner of Schools P. L. Williams.]

PUBLIC SCHOOLS OF UTAH NOT FREE.

The most striking feature connected with the public school system of Utah is that it is not a free-school system. Tuition fees are charged in every county of the Territory, and a little more than one-third of the total amount raised for schools was from this source. By section 3 of the "Act for the establishment and support of district schools," it is left optional with the district trustees whether or not they shall charge tuition fees and they are authorized to prescribe the rate of tuition. As a matter of fact the trustees heretofore have seen fit to charge tuition, and consequently the schools have not been free. Every other State and Territory in the Union has a free-school system, and it is urged by Commissioner of Schools Williams that Utah also place herself abreast of them in the cause of education.

COUNTY SUPERINTENDENTS.

"It is made the duty of the county superintendents to visit the schools at least twice in each year, to examine the trustees' records, audit their accounts, and see that they properly discharge their duties. In many counties of the Territory, where the population is large and there are many districts, this imposes a heavy burden upon the county superintendents; yet it is necessary that this duty should be faithfully performed in order to secure a steady improvement in the schools, and to obtain satisfactory results in the accounts and reports of the trustees." The law provides no compensation whatever for their services, and the only pay they have received has been a very meagre sum allowed them by the county courts. The county superintendents are usually men of small means and can not afford to take time from their regular work to look after the interests of the schools without receiving adequate compensation therefor.

NEW TEXT-BOOKS ADOPTED.

As there was considerable dissatisfaction with the books used in the public schools, and as all of them, with the exception of the readers and spellers, had been in use for five years, the time required by law before a change could be made, the commissioner of schools called a convention to adopt a new series. The convention met in June, and after full discussion adopted a new list and secured very satisfactory terms for their exchange and introduction. The books adopted were found to give very general satisfaction.

INADEQUATE SCHOOL ACCOMMODATIONS.

Although only about fifty per cent. of the school population are reported as attending school, yet the school rooms were often overcrowded with pupils, causing great discomfort and in some cases even endangering the health of the pupils. This was generally true throughout the Territory, but particularly so in Salt Lake City and County, where the commissioner of schools thinks the accommodations are sufficient for only one-third of the school population. Many districts in Salt Lake City do not own a single building, but the basements of ward meeting houses or other such rooms are used for school purposes.

REMEDY PROPOSED.

Heretofore buildings have been constructed to meet immediate necessities, and in a few years, when the population had increased, additions have been made to them. Consequently the districts now have buildings without that symmetry, unity of design, and convenience in arrangement which they should possess. It is recommended by the commissioner of schools that large and commodious buildings be erected which would not only serve present purposes but be sufficient to meet future demands. As this, however, would necessitate the immediate outlay of a large amount of money, more than could be raised in two or three years by reasonable taxation, it is recommended that districts be authorized to obtain the necessary means by issuing bonds which could be redeemed by gradual taxation.

POLYGAMY COUNTENANCED IN THE SCHOOLS.

It is stated that while there has been no affirmative teaching of polygamy in the public schools there have been many evidences of a respectful silence with reference to violations of the law against it. The commissioner says: "Perhaps the tendencies to which I refer cannot be better described or defined than by the statement made to me within the last few months by the president of the University of Deseret, that if in the course of instruction imparted in that institution generally or to the classes in civil government (where perhaps it would be most naturally presented), it should be inculcated that good citizenship exacted obedience to those laws enacted by Congress against the polygamous condition and kindred vices of Utah, it would break up the school."

PRIVATE SCHOOLS.

In Salt Lake City and other large towns of the Territory there are quite a number of private or denominational schools, which are very largely attended and which are becoming more popular and more generally patronized every year. Many of these schools are superior to the public schools. Their establishment is likely due in great part to the tuition fees charged in the public schools; the parents preferring, if they have to pay tuition, to maintain a school exclusively under their control and where they can teach any religious belief they desire. While their establishment cannot be said to injure directly the public schools, yet unless the people patronize the public schools they will not give them that earnest and active support which can be manifested in so many ways other than by the payment of school taxes, and these will be regarded as a burden only to be tolerated as a kind of public necessity.

NEW LEGISLATION.

The office of Territorial superintendent of district schools abolished.—The Forty-ninth Congress in 1887 adopted the following act: "That the office of Territorial superintendent of district schools created by the laws of Utah is hereby abolished; and it shall be the duty of the Supreme Court of said Territory to appoint a commissioner of schools, who shall possess and exercise all the powers and duties heretofore imposed by the laws of said Territory upon the Territorial superintendent of district schools, and who shall receive the same salary and compensation, which shall be paid out of the treasury of said Territory; and the laws of the Territory of Utah providing for the method of election and appointment of such Territorial superintendent of district schools are hereby suspended until the further action of Congress shall be had in respect thereto."

The commissioner of schools, in addition to the regular statistics, must state the "number of teachers who are Mormons, the number who are so-called Gentiles, the number of children of Mormon parents and the number of children of so-called Gentile parents, and their respective average attendance at school."

Instruction in physiology and hygiene.—Instruction as to the nature of alcoholic drinks and narcotics, and their effects upon the human system, is required in Utah, as in all the other Territories and the District of Columbia, by the act of Congress approved May 20, 1883. It is required, also, that teachers shall pass a satisfactory examination as to the effects of alcoholic drinks and stimulants upon the human system before receiving a certificate to teach.

Graded schools may be established.—"The trustees of any school district having a population of over twelve hundred, when authorized by a majority vote of the property taxpayers resident in the district present at a meeting called for that purpose, may establish and maintain a graded school, or a graded department in a school in such district, in which pupils may be instructed in higher branches of education than those usually taught in common schools, and pupils over 18 years of age may be admitted to and instructed in such school or department, on such terms as to tuition and otherwise as the trustees may prescribe." The trustees may collect a tax of one-fourth of one per cent. without calling a meeting for that purpose.

Slight changes in the former law.—The school census is now required to be taken on or before the second Monday in July in each year, instead of in June as formerly, and reports are to be made to the county superintendents by the 10th of August.

Certificates are no longer granted to graduates of the University of Deseret without their having passed an examination.

The property of non-residents, formerly exempt from taxation for the payment of teachers, is now taxable for such purpose.

The county assessors and collectors are made the assessors and collectors for school taxes, and all school taxes become a lien on the property assessed from the date of assessment, and are collected as the Territorial and county taxes.

[From the Report of the Commissioner of Schools to Congress in 1838.]

MAINTENANCE OF SCHOOLS.

The amount of funds collected by the three-mill tax imposed by the law of 1878 is scarcely sufficient to pay one-half of the salaries of the teachers employed, consequently it has been necessary and customary to charge tuition fees at such rates as the trustees may think necessary. In about eight or nine districts local district taxes have been levied in order to supplement the Territorial fund and thereby furnish free schools to all classes. The schools are not required to be kept up for any definite period, and there is no provision for withholding Territorial funds from districts making no provision for schools, and as no one can attend school without paying the tuition fees, many children of indigent parents are deprived of all means of acquiring an education.

ACTION OF THE LEGISLATURE.

At the twenty-eighth session of the Legislature, a bill was prepared and passed the lower house making provision for the establishment of schools on about the same plans as are found in most of the States, but in the legislative council a substitute was offered and finally passed both houses imposing a tax of eight mills on the dollar, the funds arising from which were to be distributed to the district and *private* schools in proportion to the attendance, the private schools not being subject to any public supervision or control whatever. This bill met with very little opposition, except from the non-Mormon members, but, as was expected, it received the executive veto and consequently the schools have no greater amount of funds than formerly.

SCHOOL ATTENDANCE.

The tables show that only 18 per cent. of the children of non-Mormon parents, and 40 per cent. of the Mormon children, making 58 per cent. of the school population, attended the district schools. This is to be attributed to a lack of public interest in the schools, the establishment of private schools, defective legislation, and charges for tuition. For somewhat similar reasons a sufficient number of school-houses has never been provided, and although the attendance at district schools has never been so large as should be expected, there has been a great lack of comfortable accommodations for those who did attend; and it is probable that if good school-houses were provided there would be much better attendance notwithstanding the other unfavorable conditions.

PRIVATE MORMON SCHOOLS.

There has been great interest manifested lately in the establishment of private schools by members of the Mormon Church in which instruction could be given in the religious beliefs of the denomination. Efforts have been made by the leaders of the Mormon Church to secure funds for this purpose, as they are anxious to establish one or more private schools in each "stake," the stakes generally corresponding in territory to the several counties. This movement has received the earnest support of Wilford Woodruff, who is chairman of the church board of extension and also president of the Mormon Church.

VERMONT.

[From Report for 1836-37 and 1837-38 of State Superintendent Justus Dartt.]

GENERAL CONDITION.

The enrolment for the two school years was smaller than it had been for ten years, but the average attendance was greater than for the three previous years; consequently it would seem that the pupils had been more regular in their attendance, but the State superintendent complains of great irregularity in attendance still. The average duration of schools for the two years 1836-37 and 1837-38 was one hundred and thirty-nine and one hundred and thirty-seven days respectively, but the average number of days' attendance of each pupil enrolled was only eighty-eight for the first year and ninety-

two for the second—showing a loss of more than one-third of the time the schools were in session. As a census of the school population is not taken annually, it is impossible to ascertain the number of children not attending school. Although there is a law for compulsory attendance, it seems to have fallen into innocuous desuetude.

GRADED AND HIGH SCHOOLS.

The total number of these in the State is forty-seven, and during the year 1887-88 there were 14,647 pupils attending them. These schools are the most prosperous ones in the State and are making great improvements. The salaries of the principals range from \$700 to \$2,500, which is much more than that received by teachers in ungraded schools. About four-fifths of the children can not attend the graded schools, however, but must receive all their education in the ungraded country schools, which are poorly supplied with charts, globes, blackboards, etc., and where the teachers are frequently poorly qualified to discharge their duties, and perhaps have only taught a year or two, as is shown by the recommendation of town superintendents that no person under eighteen years of age be permitted to teach in the public schools.

TEMPERANCE INSTRUCTION.

The Legislature in 1886 passed a law requiring all the pupils in all the public schools to be taught physiology and hygiene with reference especially to their effects upon the system, and that the books on this subject should be furnished the pupils at the expense of the State. A committee appointed by the Governor to select such books decided upon the following:

- (1) Child's Health Primer, known as Pathfinder No. 1; (2) Hygiene for Young People, known as Pathfinder No. 2; (3) Lessons on the Human Body, by Orestes M. Brands; (4) Hygienic Physiology, by Prof. J. D. Steele.

Each town superintendent in the month of January annually makes an estimate of the number of books of each kind which will be needed in his town and notifies the secretary of state, who has them forwarded to him. If pupils wantonly destroy or injure the books, the town superintendent shall take steps to collect damages for the same.

The number of such books furnished from January 1, 1887, to May 31, 1888, one year and five months, was 75,779; and the cost to the State was \$25,554.48.

A very considerable difference of opinion is manifested as to the advisability of the measure adopted; the State superintendent regarding the length of time the pupils are required to devote to the subject as unreasonable, some town superintendents that the study should be optional, others regarding the measure as the hardest blow ever given the common schools, while others state that both pupils and parents have been very much interested in it, and that it will prove of great value.

Such diversity of opinion is to be attributed in great part to different interpretations of the law; some holding that the pupils are required to devote one-fourth the time of their whole school life to the subject, while others think they have complied with the law when they have used the books as supplementary readers.

FREE TEXT-BOOKS.

Superintendent Dartt again urges the adoption of the free text-book system, which he states has been in operation in Philadelphia nearly seventy years, in New York City more than fifty years, and in Newark, Jersey City, Paterson, and New Brunswick, in New Jersey, for many years, and has now been adopted in many other places.

Some of the objections urged against it are that it increases taxation, that the ownership of books by the pupils cultivates in them independence and self-reliance, that the school-books are convenient for study and reference after one's school days are ended, and in many cases are the only books in the child's home.

But it is claimed that while it increases taxes, it is a legitimate tax; that since the State requires the use of certain books, it necessarily follows that the books should be free; that the system of free text-books is no longer an experiment, but has given general satisfaction; that it effects a saving of time and expense, secures uniformity of text-books and better books, a better classification of pupils, cultivates in pupils respect for public property, increases school attendance, and removes caste distinctions.

Many of the town superintendents also urge free text-books.

TOWN SYSTEM.

The town system of management of public schools, or township system as it is called throughout the West and South, prevails in twenty-six towns, while sixteen towns tried it, but after a year or two abandoned it. It is very strongly advocated by the State superintendent of public instruction, many of the town superintendents, and by the teachers generally.

At a meeting of the American Institute of Instruction it was—

"Resolved, That we commend the adoption of the town system in the administration of schools, as now sanctioned by the successful experience of all the States foremost in education."

Superintendent Dartt recommends that the system be adopted by the State as a whole and not by individual towns.

SUPERVISION.

The schools of each town are supervised by a town superintendent instead of a county superintendent, as we find in so many of the States. The State superintendent recommends that the local management of the schools be by a board of directors elected by the town; but quite a number of the town superintendents advise that the schools be placed under the direction of a county superintendent, who should be required to devote his whole time to the work.

RECOMMENDATIONS.

Superintendent Dartt makes the following recommendations:

- (1) That a census of the school population be taken annually.
- (2) That school taxes be equal throughout the State.
- (3) That the school taxes of each town, together with the income of all other town school funds, constitute the school money of such town.
- (4) That the district system be abolished in the whole State, and that the schools be in charge of a board of directors elected by the town.
- (5) That small schools be consolidated, and none be sustained with less than ten scholars.
- (6) That provision be made for the transportation of all children who could not otherwise attend.
- (7) That all children of good health and of suitable age be required to attend school for at least twenty weeks each year.
- (8) That all text-books be furnished free by the towns.
- (9) That the school year be made to end with the 30th of June instead of March 31.

VIRGINIA.

For information contained in this Report relating to education in Virginia consult the Index. If the State School Report is received in season an abstract of it will be given at the close of this volume.

WASHINGTON TERRITORY.

[From the Governor's Report to the Secretary of the Interior for 1887-88.]

The total population of the Territory in 1886-87 was 143,669, and in 1887-88 it was estimated to be 167,982. The school population in 1886-87 was given by the State superintendent of education as 18,506, and if it has increased in the same proportion as the total population it is now more than 21,000. The Governor says: "The excellent character of our statutes on the subject of public schools and the liberality of our people in levying taxes for public education of our youth was shown in a very striking manner, in my report for 1887, and the Territory has not varied its record in those respects during the past year."

"During the summer and autumn of 1887 I visited every prominent locality and all but two of the counties of the Territory in order to become personally acquainted with its topography, resources, and condition. Amongst the noticeable features of the landscape everywhere was the white school-house. They confront you not only in the cities, but in the villages and hamlets and beside the country roads. The people take pride in them and keep them in good shape. I visited the public schools in many places and was struck with the healthful appearance and physical beauty of the children. That they were true Americans was demonstrated by the fact that they demanded a speech every time; in one case, at Walla Walla, refusing to excuse me even when the bell rang for recess and their companions from the other rooms went clattering along the halls."

"The class of teachers in the public schools, with whom I had opportunities of conversing, seemed to be, with few exceptions, men and women of high aims."

There are, in different parts of the Territory, quite a number of private schools, academies, and colleges that are assisting very much in promoting education, and are meeting with much success.

SCHOOL LANDS.

"There have been no disclosures on the subject of school lands since my last report, except the passage of an act by Congress authorizing boards of county commissioners to

lease them to individuals on certain conditions. This will increase the revenues available for school purposes by the amount of the rents derived at once, and the improvements that will be made will in all probability add to the value of the lands and increase the amount that will ultimately be realized from their sale."

ARBOR DAY.

There is much land in the Territory that is not suitable for agricultural purposes, but could well be used for a growth of forests. In order to give encouragement to tree planting the Governor urged the Legislature to establish an "Arbor Day" to the schools, but the matter was overlooked. So great an interest in it is now being taken, however, that it is very likely that the next Legislature will pass a law upon the subject.

WEST VIRGINIA.

[From Report for 1886-87 and 1887-88 of State Superintendent Benjamin S. Morgan.]

TEACHERS' SALARIES.

The failure of the teachers to receive prompt payment of their salaries is a cause of much complaint. In many cases they are required to wait months before being paid or to discount their claims very heavily, or else enter suit before a justice or circuit court, which is an unpleasant recourse, especially so for lady teachers. In case of other orders on the county treasurer which can not be paid, the sheriff is required to indorse them, and if they are due at the date of presentment they draw the legal rate of interest from that time. This is not done, however, in case of teachers' orders on the county treasurer, which is manifestly unfair treatment. In order to secure and retain teachers fully qualified for their work, they should be assured that their salaries shall be regularly and promptly paid, for even then they are not fully compensated for the work done.

GRADED COURSES FOR COUNTRY SCHOOLS.

The present school law simply requires that certain branches shall be taught in the public schools, without giving any classification of the studies, or stating how long each shall be studied. Hence, with every change of teachers, and at the beginning of every term, a new arrangement of classes is made without regard to any definite course of progression. The superintendent recommends that the State board of education, under the direction of the State superintendent, be required to prepare a manual and graded course of study for ungraded schools, to be printed and distributed for the education department. "Such a course of study, partaking somewhat of the character of a manual, would serve a valuable purpose as a guide to the teacher, and especially to the young teacher; it will encourage the pupil by preventing a great deal of useless repetition, and aid in securing more regular attendance; it will aid the county superintendent in the work of supervision, and bring his influence more directly in connection with each school, and therefore make his work more effective; it will give the ungraded schools a higher and closer organization, and therefore give the entire system greater strength."

An experiment of this kind was tried in Monongalia County as early as 1876, with very gratifying results, and since then it has been adopted in many other counties of the State, as well as in many States of the Union.

COUNTY SUPERINTENDENCY.

It is not sufficient for the State to levy and collect a school-tax, build a school-house, and employ a teacher, but it should also have some one to superintend and direct the work of the teachers, see that it is properly done, suggest improvements, and aid in securing a proper classification of pupils. Every city has its superintendent of schools, although in cities the schools are generally graded and have better teachers than the country schools, and therefore do not stand in such great need of supervision; but so advantageous has it proved to be, that under no circumstances would the cities dispense with the school superintendent. In the ungraded country schools we find the pupils badly classified, no well-defined course which they are expected to pursue, and the teachers very frequently incompetent, and, in addition, the teachers are frequently engaged in the work for the first time; for it is estimated that fully 20 per cent. of the teachers employed each year have had no experience. A large portion of those who enter the work do so because it is the most remunerative employment they can secure just at the time, and are only waiting to receive a better offer, when they are glad to accept it. It is for these reasons that the country schools stand in such need of a county superintendent. During the time the county schools are in session the superintendent should be required to devote his entire time to them and to teachers' institutes, and in the summer when the schools are not in session he should hold county institutes. In order that

he might have sufficient time to fully acquaint himself with his new work and to inaugurate and carry through any reforms found necessary, he should be chosen for a term of four years instead of two. It is frequently said in objection to this that if a county superintendent proves worthy the people will re-elect him, but this is not corroborated in the practical working of the office, for it is too often found that the superintendent is displaced simply for discharging fully his duties. The officer should live at the county seat, and should be paid a liberal salary; enough to secure the best teacher in the county.

HIGH SCHOOLS.

The educational institutions of the State are subdistrict schools, graded schools, high schools, normal schools, and the State University; they should be so arranged as to meet the interdependence that should exist between them. The common and graded schools must look to the normal schools and State University for their teachers, and the high and normal schools must depend upon the ungraded schools for their students, and the State University looks to the graded and high schools for its students. The course in these different schools should be arranged to suit each other, and not left to the gradual changes of years.

The high schools so far, however, have entirely failed to accomplish their purpose, and in addition have destroyed the old academies which they were intended to supersede. They are not only too few in number, but their course of instruction is too low and their work inferior. Hence there is a break in the connection between the subdistrict schools and the State University. The law as existing for the last twenty years has allowed the establishment of district and joint district high schools, but there is not a single district high school in the State. Experience shows that the high school district should be larger than the graded school district, and in most cases it should be coterminous with the counties. The ordinary school districts do not furnish a sufficient number of well-advanced pupils to support a good high school, and for this reason the high school district should be larger. The second essential to the establishment of good high schools is State aid. In many of the States this aid has been given, and it has proved to be a wise step. There will at first be some opposition to the schools, but when they get in regular operation and their good effects begin to be seen they will be highly appreciated.

TEXT-BOOKS.

The present contract for furnishing school books expires in 1890, but the superintendent, after examining a number of different plans in other States, thinks none better than the one now in operation in the State, and as the text-books now in use give very general satisfaction, no change in this respect should be made. It is recommended, however, that provision be made by law for furnishing text-books free of expense to all indigent pupils. Some of the States have gone further, and furnished free text-books to all the pupils, and the law gives general satisfaction. As a result, there is a larger and more regular attendance, better classification, and no waste of time at the opening of the term, and less expense.

PHYSIOLOGY AND HYGIENE.

The requirement of the law that physiology and hygiene be taught in the public schools, with special reference to the effects of narcotics and alcoholic stimulants upon the human system, meets the general approbation of teachers and patrons. The law has not been obeyed entirely, however, as no text-book on the subject was chosen, and teachers were not required to be examined on the subject until after January, 1889, which gave the impression to many that the study was not to be introduced till after that time.

SCHOOL LIBRARIES.

The importance of establishing libraries in connection with the public schools is beginning to be very generally recognized. They serve to protect the children to some extent from the evil influences of the pernicious literature which is now so generally circulated and which is made so seductive to youthful minds; moreover, the public school libraries cultivate in the young a desire to read, and under the wise guidance of a discreet teacher a desire for good literature is implanted, in the gratification of which much historical and biographical knowledge may be obtained.

COMPULSORY ATTENDANCE.

The sentiment in favor of a compulsory attendance of all pupils upon either public or private schools is becoming stronger each year and has been attempted in several States with varying degrees of success.

MANUAL TRAINING.

The subject of manual training in the public schools or in schools established specially for this purpose is now receiving much attention. While other States are making great advances in educational matters it does not become West Virginia to be lagging in the rear, and so it is advisable that a committee be appointed to investigate the subject of industrial education, as to whether it should be ingrafted upon the public school system or separate schools be established for the purpose.

RECOMMENDATIONS.

The following recommendations are made by the superintendent: That the employment of children under a certain age in factories, mills, or mines during the time the schools are in session be prohibited.

That boards of education be authorized to provide books and stationery for indigent pupils.

That the four years' certificates of teachers be renewable after the expiration of three years.

That the State board of education be authorized to establish a graded course of study for ungraded schools.

WISCONSIN.

[From Report for 1886-87 and 1887-88 of State Superintendent Jesse B. Thayer.]

SCHOOL ATTENDANCE.

The statistics of the year 1886-87 presented some remarkable and unexpected features, as they showed a decrease in all the items concerning which statistics were collected; even a decrease in the number of children of school age in the State, while it is well known that the population of the State has been rapidly increasing. This apparent decrease in the school population is very likely due to the system of joint school districts, the clerks of different districts being required to report the facts relating to schools to the town clerks, and it is very probable that many duplications were made. The law recently passed requiring the clerks when taking the census to take the name and age of each person, and with whom the same resides, very probably was the means of preventing many persons from being reported twice. The statistics of the cities did not show any decrease, but only the rural districts.

The attendance at school was smaller than in the previous year, and was occasioned to a large extent by the deep snows and stormy weather of the winter of 1886-87. In many instances the trustees were compelled to close the schools for one or two months, thus shortening the school term to that extent.

It is thought, too, that a larger number of children than usual attended private and parochial schools; but as no reports from these are made, although the law requires all chartered institutions to do so, it was impossible to ascertain the exact number of children attending them. Superintendent Thayer thinks that all such schools should be required to report at least the number of children attending them.

After all due allowance, however, has been made for these causes, the fact remains that the number of children attending the schools, and the number of days the schools were in operation, were much below what might reasonably be expected; and it should be ascertained whether this is due to anything connected with the schools, and, if so, in what way it might be corrected. In all the States there is a large number of children who do not attend school, and this should especially be expected in a new State like Wisconsin, where the people are constantly pushing farther out into the unoccupied lands where there are no schools, and even if there were the amount of work to be done in preparing land for cultivation, in building houses, etc., would be so great that little opportunity could be afforded children to attend school.

TOWNSHIP DISTRICTS.

Superintendent Thayer thinks that it should be considered whether the schools are not failing to accomplish what should be expected of them on account of their adhering to the old district system, a system which may have served a useful purpose in its time, but which is now being abandoned in many States, and in others the propriety of doing so is being considered. The district system requires the appointment of about eighteen thousand men in the State to attend to school affairs, and it is very probable that if fewer such officers were needed better men would be found, and the schools would soon begin to improve in many respects. The appointment of intelligent men who were interested in the success and prosperity of the schools would prove highly advantageous to them.

COURSE OF STUDY FOR UNGRADED SCHOOLS.

Much attention was given to the subject of establishing a regular course of study for ungraded schools, and so far as adopted it proved of great advantage in securing systematic and progressive work; and the desire of children to complete the course and to be able to stand a successful examination before the county superintendent, and to receive a certificate thereof, proved a valuable incentive to study. It is thought, too, that the adoption of such a course would be of great assistance to young teachers, as it would be a valuable guide to them in outlining the work to be accomplished.

TEACHERS.

The great majority of applications for teachers' certificates made and granted are for those of the lowest grade; of the 8,826 certificates granted during the past year only 435 were of the first grade and 1,058 of the second grade, and in the previous year still fewer first and second-grade certificates were issued. It is thought that the law of 1887, giving greater value to first and second-grade certificates, will induce teachers to make greater efforts to obtain them.

The requirement of the law that teachers shall pass a satisfactory examination in physiology and hygiene, and other studies, did not diminish the number of teachers receiving licenses, for the persons wishing to receive teachers' certificates at once began to qualify themselves in these branches. Superintendent Thayer thinks that some other studies should be added to the list required, namely, botany, elementary physics, and that branch of physiology which treats of animal life generally, and the laws of growth and health of domestic animals. It is thought that by including these in the common-school curriculum, the instruction would be of a more practical character, and thereby be of greater interest to the pupils.

HIGH SCHOOLS.

A larger number of free high schools is reported than heretofore, and there is a larger attendance upon them. Their establishment has not interfered at all with the graded schools, and the appreciation of them is increasing. It is to be regretted that a larger number of towns, where there are no graded schools, have not availed themselves of the aid offered by the State for the establishment of high schools.

SCHOOL EXHIBIT.

The Legislature appropriated two thousand dollars for the purpose of making an exhibit of the work and condition of the public schools of Wisconsin at the National Centenary School Exposition held in Chicago, in July, 1887, in connection with the annual meeting of the National Educational Association. An extensive, well-arranged, and creditable exhibit was made of work of the public schools, normal schools, and State institutions, and at the close of the exposition at Chicago, the material was shipped to Milwaukee, where it was exhibited during the months of September and October, and afterwards returned to the contributors.

LIBRARIES FOR SCHOOLS.

Not much has yet been done towards establishing libraries under the recently enacted law, about thirty per cent. of the towns of the State having taken some steps in this direction. Some defects have been encountered in the administration of the law, but they may be easily remedied.

WYOMING.

[From Report of the Governor to the Secretary of the Interior, September 19, 1888.]

"The public schools in Wyoming are well attended considering all things, and are an honor and credit to the Territory. The superintendents, principals, and teachers are earnestly devoted to their work, and will compare favorably with those of any State or Territory." The leasing of the school lands can be made to yield a large fund for schools, and relieve the tax-payers of much of their public burden.

CHAPTER V.

DISCUSSIONS OF EDUCATIONAL QUESTIONS, CHIEFLY BY STATE SUPERINTENDENTS.

ADMINISTRATION—Arbor Day—Compulsory Attendance—Discipline—Education—Evening Schools—Graded Schools—High Schools—Hygiene—Irregular Attendance—Language of the Public Schools—Libraries for Schools—Manual Training—Moral Training—National Aid—Private Schools—Prizes—Public Schools—Revenue—School-Houses—Supervision—Teachers—Temperance Instruction—Text-Books—What shall be Taught in the Public Schools—Word Method of Teaching Reading.

I.—ADMINISTRATION.

Township districts adopted in Indiana.—Superintendent Holcombe, of Indiana: At first every school district was independent, with a school board of its own. This plan was found to be ineffective, wasteful, and extravagant. All the districts of a township were, therefore, united into a school corporation under a single responsible trustee. This was a great step in advance. Order began to prevail and some life appeared in the schools.

Township districts favored in Missouri.—Superintendent Coleman, of Missouri: I greatly favor the township as the unit for the district. We have too many districts and, therefore, too many school boards. One board in a township, and a township tax to maintain the schools, would greatly simplify our system, giving more uniformity to the schools, length of term, and efficiency of school work and discipline.

Give satisfaction in Rhode Island.—Superintendent Stockwell, of Rhode Island: So far as the towns have changed (to the township plan), the people are thoroughly satisfied that they get better schools for less money. I do not believe that there is a single advantage to be secured by the so-called district system as a system.

What would be secured.—Superintendent Thayer, of Wisconsin: I am most cordially in favor of an obligatory township system of school government. I am of the opinion that:

- (a) It would greatly equalize the cost of public schools.
- (b) It would almost entirely remedy the evil of inconvenience to school-houses by permitting every child to attend where most convenient.
- (c) It would do away very largely with the controversies over boundaries of school districts and the location of school-house sites.
- (d) It would secure better school-houses and better appointments.
- (e) It would secure better teachers by diminishing the opportunity for the prevalence of unworthy motives; would make it easier to secure uniformity and free supply of text-books; would promote the efficiency of the township system of libraries; would promote some measure of local supervision; would insure the adoption of a course of study in ungraded schools.

(f) It would especially be useful in the way of such disposition of the available teaching force in the town that the greatest utility would result. The "misfits" of teachers and districts are a large factor in the failure of schools.

Some of the advantages.—Superintendent Hine, of Connecticut: The township system has the following advantages:

- (a) Greater efficiency of management.
- (b) Because the system is co-ordinate and not dislocated.
- (c) More public interest in schools, because the matter is of greater importance.
- (d) There results always more schooling for the children.
- (e) Equality of advantages, continuation of teachers in more places.
- (f) A course of study pursued continuously to the end.
- (g) Better buildings and material.

Better men could be secured as directors.—Superintendent Smith, of Tennessee: The township district is decidedly the plan for Tennessee. I favor the township plan because we have several object-lessons in Tennessee that speak louder than words. The

fewer men you have to manage the schools, the better. We can secure good directors on the township plan with but little trouble; the other plan gives much trouble.

Gives satisfaction in Alabama.—Superintendent Palmer, of Alabama: By our fundamental law every township is a school district and a body corporate, and there has been no disposition to change it, and the system gives satisfaction.

Advantages of.—Superintendent Thompson, of Arkansas: In the township a larger number of voters would give a more general expression of the popular will, and more interest would be manifested in selecting good men for school directors. The township as the school district would do away with the necessity of transferring from one district to another; the schools would be as convenient as they are under the present system, the people would retain the same absolute control over the schools, and equal privileges be secured to all. At present, locality determines the length of the school term and other privileges; for instance, one district has a school for eight or nine months, with a comfortable house and excellent teacher, and in the same neighborhood, in another district, though the number of children is greater, there is only a three months' term.

How it works in New Hampshire.—Superintendent Patterson, of New Hampshire: It will no longer be possible for a rich district, by squandering surplus funds on a few pupils, to deprive all the other scholars in town of a portion of their legitimate schooling. It will no longer be possible for the village child, unless under special act, to secure thirty or forty weeks of schooling, while the boy or girl on the farm gets but ten or fifteen because he happens to live in a poor district. It will no longer be possible to limit a heavy tax-payer in a poor district to half the schooling of a non-taxpayer in a rich one. The law makes the town as at first the political unit of the State, and is in the interest of equality and fair play.

No law ever encountered at the outset, greater or more groundless prejudices than this, and none ever disarmed opposition more quickly, and demonstrated its power to benefit the State. Though the sum paid teachers is \$10,328 less than last year, the average length of school has been two weeks more. There has been a more equitable distribution of educational opportunities than formerly, and, as a rule, better teachers have been employed.

* * * * *

The reports from the school boards generally indicate that the new law is settling down into an efficient and orderly system, and that the people, as they become accustomed to it and recognize its power to eliminate chronic evils and vitalize the schools, are disposed to cherish and maintain it.

In favor of it.—Superintendent Draper, of New York: I am myself inclined to favor the proposition, in the belief that it would result in securing a better class of men for trustees in the rural districts, and that the levying of a tax upon the entire town for the support of the schools of the town would operate to the advantage of the weaker outlying districts.

What might be expected of it.—Superintendent Edwards, of Illinois: As a consequence of the establishment of this system, I should expect to see better organization, better grading, an elevation of the standard of teachers' qualifications, more methodical and efficient work in the schools. Under that system schools would not be isolated as they are now. They would be each a part of a reasonable system.

A county system in Maryland.—Superintendent Newell, of Maryland: There are no townships in Maryland nor, so far as I know, in any of the Southern States. The unit of authority and direction for schools and other purposes is the *county*. I am glad that such a monstrosity as the *district system* has never been known among us. If we had it we should make every effort to get rid of it.

Township districts will be adopted.—Superintendent Estabrook, of Michigan: The system is sure to prevail. We shall come to look on our present system as if under dark ages. * * * The merits of the system cannot fail to commend themselves to the judgment of all who will give it their careful and candid consideration.

Works well in Massachusetts.—Superintendent Dickinson, of Massachusetts: The township system works infinitely better than did the district system.

Secures good local management.—Superintendent Morgan, of West Virginia: Under this system our schools have the advantage of a careful local management and all the advantages of the district system.

Gives satisfaction.—Deputy Superintendent Stewart, of Pennsylvania: The township system is entirely satisfactory.

Is being adopted in Maine.—Superintendent Luce, of Maine: The increase of fifteen in the number of towns that have discarded the district system—a very marked increase as compared with the number abolishing in any previous year—is, therefore, evidence of better schools in as many towns. It is also evidence of the growth of a public recognition of the need of reform in this direction, and is thus a promise of better things to

come. The Legislature of 1887 can do no more beneficent work for the State than to wipe from the statutes every provision therein, under and by which the school-district system exists.

All experience goes to prove beyond possibility of disproof that schools managed on the town plan are more economically managed, and are in every way more efficient than those managed on the district plan.

Desired in Vermont.—Superintendent Dartt, of Vermont: The experience of another two years in the common schools of the State has still more fully convinced me of the utter inefficiency of our plan of district management. A large number of our people have felt this to be true for some time, and have urged a change throughout the whole State. These people are intelligent; they are actuated by unselfish motives, and have a strong desire to see our schools lifted out of this low and unsatisfactory condition to one of efficiency, strength, and progress. No movement was ever advocated with a more patriotic spirit than this one for the improvement of our system of education for the children of our commonwealth, and none is worthier of the careful, unprejudiced, and thoughtful consideration of our citizens.

It is worthy of note that most of the teachers and nearly all others who have been practically connected with the schools, favor the change of the district for the town management. Nearly every gathering of teachers in the country has indorsed this movement. * * * Not only is the district system inefficient, but it is inequitable and unjust. It discriminates against the poor in favor of the rich, and gives no equality of opportunities, having wholly outlived its usefulness as a promoter of intelligence among the people.

* * * * *

There are now in Vermont thirty towns using this system, and it is working well. As for myself I believe in the town system. The old district system has served its day and should be now made to give place to a better. * * * This town system is right in the line of *progress and it can not be stoppèd*. It will move on in spite of ignorance, prejudice, and parsimony. Let us work for it. We are right, and I believe the right will prevail.

Township districts desired in Texas.—Superintendent Cooper, of Texas: In the States which have been divided into townships, the town has been found to be the most satisfactory unit for the subdivision of the county for school purposes. The plan of forming districts so small that one school for each race will supply the needs of all the children in the district has been found to be liable to nearly the same objections which have been found to lie against the community system in Texas. The North-western States, where we find the best system of rural schools, are gradually abandoning the one-school district for the township district, containing from five to fifteen schools. Some of the Southern States have adopted the township district, notably Alabama, and all find it the best possible unit. This instructive fact will furnish us with a safe guide in fixing the general size of school districts. The area of the township is about 36 square miles.

II.—ARBOR DAY.

Why we should have an Arbor day.—Superintendent Hoitt, of California: We have heard much and read more of the wanton destruction of our forests. Our schools can not protect the forests, but they can raise up a generation which will not leave our hill-sides and mountains treeless; a generation which will frown upon and rebuke the wanton destruction of our forest trees. There is no spot on earth that may not be made more beautiful by the help of trees and flowers. If, under the influence of a manifest destiny, the child must inevitably leave the home of his childhood, we may at least surround the home with beauty and make it attractive, so that his heart, in whatever distant land it beats, shall, like the sea-shell far from its ocean bed, retain some faint whispers of its early dwelling place.

Trees everywhere exert a controlling moral influence. We may not be able to tell why or how it is done, but the fact we know and feel in our every day's existence. Every sapling which we plant in our door yard or upon the naked sidewalk in front of our dwellings makes, with every spreading branch, expanding leaf, and opening blossom, home pleasanter and recollections of it stronger. Our schools bear a near relation to the State, but a much closer relation to the family, and when school opens the family life of the whole district is stirred up as if it were a festival day. We should not be satisfied till the school grounds, as well as our homes, are such in themselves and in their surroundings as shall not only be attractive, but shall surely tend to strengthen, elevate, and ennoble human character.

Let us have a legally appointed "Arbor day," and take the children out of our schools, and, under proper directions, teach them how to plant shade trees, shrubbery, and flowers. Teach them how to prepare and plant the lawn with their own hands, and to care

for these things when they have been planted. Thus may over a quarter of a million of children be taught to think of the value of trees, become familiar with them, and learn to love them. Thus may they take the hand of nature and be led to noble thoughts and worthy deeds. For one day, at least,

"Come forth into the light of things; let Nature be your teacher."

Good effects of Arbor day.—A. F. Hess, school superintendent of Jefferson County, W. Va.: Arbor day has accomplished much good in having our school grounds properly fenced and beautified.

Arbor day may be devoted to general improvement of school grounds.—Superintendent Higbee, of Pennsylvania: Many of our schools for various reasons were not able to observe the regular spring Arbor day in answer to the Governor's proclamation. We are anxious that the good work so happily begun, may continue and give still larger results for the benefit of the schools, and for the general good of the Commonwealth. It is not necessary to confine Arbor-day work exclusively to the planting of trees. The proper grading of school grounds, the removal of stones and all refuse, the careful guarding of trees against the winter winds, the protection of tender shrubbery from destructive frosts, the dissemination of useful information on the subject of fruit and shade trees, of forestry, and landscape gardening, the gathering and storage of seeds for the next spring's planting, botanic lessons especially devoted to the flora of the district, with definite reports from season to season of what has been done in the locality, what good results have followed therefrom, and what it is proposed shall yet be done—all these are proper subjects for Arbor-day observance, and well deserve attention.

Such digression from the ordinary routine of school work will be profitable to the children in many ways. It will give them some sense of what they themselves can do by organized effort, having some definite aim in view. It will challenge them, each and all, to take part in work for the general good, and help to awaken a proper pride in the good appearance of the whole neighborhood in which they live. It will add to their habits an aesthetic culture, which will increase with their increasing years; and the vision of what their own hands have done in beautifying their school grounds and improving and adding value to their home surroundings will delight them more and more as season follows season, through not only their school life, but that more mature life of manhood and womanhood, for which, in large part, the school is designed to make preparation.

III.—COMPULSORY ATTENDANCE.

The necessity for compulsory education.—C. E. Walling, school superintendent of Morgan County, W. Va.: Some say we must educate the masses so they will appreciate an education; but how are we to do it? The greater number who do not avail themselves of the opportunity offered by the free schools are the children of poor and ignorant parents, who will be allowed to grow up in ignorance, and generation after generation will do the same unless the law forces them into school until the one generation is educated, then the greatest difficulty will be overcome. If parents are remiss in their duties to their children, and not aware of the great responsibility resting upon them, they should be made sensible, and be compelled to discharge a parent's duty.

IV.—DISCIPLINE.

The model school-government.—School committee of Salem, N. H.: There can be no permanent prosperity or real progress unless the scholar is subject to the rules. Where this does not exist the teacher is nothing and the school is worthless. It should be a discipline founded on respect, a government administered by leading rather than driving the pupil. To have it perfect, there should be a willing obedience to authority without the display of passion. True discipline is something more than mere order; it is a cheerful submission on the part of the scholar to his instructor, not from fear, but from love. The teacher wins the heart, inspires reverence and esteem, in a word, governs without seeming to govern or causing the pupil to feel that he is governed.

Good discipline the first essential of a good school.—Superintendent William E. Buck, of Manchester, N. H.: Correct habits are largely the result of proper discipline; therefore good discipline is the first essential of a good school, and one's ability agreeably to discipline a school properly is the first mark of his fitness for a position at the teacher's desk. Ordinarily, the condition of the American family is such, at the present day, that good order at school is generally and agreeably secured by the good sense and tact of the teacher, supplemented by the moral support of parents; but occasionally an apparently incorrigible pupil is encountered, who, "like a hornet in a bee-hive," brings consternation to the queen, creates confusion in the swarm, and threatens all with destruction. In the bee-hive the death of the offender or his expulsion is immediately deter-

mined; and in the school the wilful disturber must be promptly met with subjection or exclusion.

It may be properly inferred from the foregoing that, in the matter of school discipline, I regard as best the mildest means that can be made successful, but that the means must be successful at all hazards. So it would seem that there may be instances where corporal punishment might be regarded as justifiable; but it should be inflicted only as a last resort, and then not hastily or inconsiderately. I hold it safe to enunciate the general principle, that whatever a judicious parent may rightfully do in the matter of correcting his child and enforcing obedience, the teacher, standing in the place of the parent, would be justified in doing; and yet, while believing that corporal punishment is justifiable in some instances, I think it well that the teacher should consider in each case appearing to merit its infliction whether it would not be wiser to pursue a different course from what the parent even would be likely to take in regard to a misdemeanor deserving corporal punishment; for the teacher has the parent back of him, and, by conditioning the case so that the parent will have to take cognizance of it, the co-operation of the parent may be secured when otherwise it might be antagonized.

The alternative for corporal punishment in school is suspension therefrom; and in no instance when such suspension occurs should the pupil be allowed to return to school, except under conditions which would cause him, his parents, the school, and the teacher, all to feel that whatever of good could have been gained by the infliction of corporal punishment had been attained, unless, indeed, it should become clear that the case was not deserving of such punishment.

Corporal punishment discouraged in Louisiana.—Rules and regulations of Louisiana State board of education: Rule 27. Those teachers who are the most successful in maintaining the order and discipline of their pupils, without the use of corporal punishment, other qualifications being sufficient, shall be awarded by the board a higher degree of appreciation, and be preferred above all others in promotions and appointments.

Corporal punishment sometimes necessary.—City Superintendent Bettison, of New Orleans, La.: While it is true that in the best schools there is the least punishment, and that the best disciplinarian is he who can cause his pupils to govern themselves, it is not to be inferred that it is a teacher's duty to submit to anarchy rather than to resort to corporal punishment.

V.—EDUCATION.

Education the defense of the State.—Territorial board of education of Dakota: We recognize the influence of education upon the individual, in the family, the church and society, but do we not overlook the fact that it is the defense of the State? Education is, in the highest sense, the charge of political society. It is so important an agency as to justify compulsion on the part of the State. To education the State must look for trained patriotic citizenship, for the promotion of morals among the people, and for assurances for continued progress in everything that is wise and beneficent in our present civilization. The State should guarantee to every child a good education, and compel the attendance of those who would voluntarily absent themselves, or whose parents, through motives of avarice or neglect, would prevent attendance. The obligation of free education is with the State, and no local influences should be permitted to deprive any child within the State of some opportunity for at least an elementary education. It may be opposition to free public schools, it may be poverty caused by drought or cyclone, it may be extravagance in taxation, it may be the general neglect of local officers; no matter. In any case the State should step in with some funds and provide a school for a short time, and enforce the attendance of all children of school age.

Public education not a matter of charity.—Superintendent Finger, of North Carolina: Very frequently we hear the statement that it is robbery to tax one man to educate another man's children. This sentiment prevails to some extent everywhere, I suppose, and those who hold it regard public education as a *charity*. They are, perhaps, willing to dole out a little education to the poor on the same principle that they would give them a loaf of bread to keep them from starving.

Such persons reason from other premises than those which the founders of our Republic used in support of public education. The foundation of public education is *broad statesmanship* and not *charity*. The friends of the public schools in the past, and now, do not think that our property or our lives are safe in the hands of ignorant voters, and they do not think that our free governmental and religious institutions can long exist without liberal provisions made by the State for the education of all the voters. They believe that the rich man, who does not even think enough of the public schools to patronize them by sending his own children to them, is made richer by them, in that he is made securer in the possession of his wealth, and that verily his contribution to them "does not impoverish him."

Besides, it is a fact that any man may know by a little investigation that general in-

telligence and material prosperity and power go together. We have in our own country many illustrations of this fact in the history of States and communities. I need not point them out. Perhaps Prussia affords one of the most notable illustrations of this fact.

The value of an education not to be estimated in dollars and cents.—From report of school committee of Kingston, N. H.: Knowledge cannot be weighed in a commercial scale. The primary question is not whether a man can make ten dollars per week, uneducated, or twenty dollars per week, educated; it is, how can he make the most of himself, how can he best develop his personality, how can he accomplish the greatest good for the greatest number? It is here that our so-called business colleges err in principle, their aim being to educate so that their graduates may get money, and make money-getting the mainspring of life. The dollar suspended before the mental vision by these institutions is so very large that it obscures the nobler motives, so that goodness, honor, and philanthropy are seen but dimly, if seen at all. A bright young fellow recently asked, "What good will it ever do me to study algebra?" He was measuring the value of knowledge by this little tape-measure whose divisions are the symbol \$. It was explained to him that the "good" consisted in the mental advancement accruing from disciplining the mind to systematic reasoning; that while he might never use what he learned in the exact form in which he learned it, and while he might apparently forget it, yet the effect of his study would remain through life in the ability to think better and to grapple more successfully with difficult questions. An esteemed friend recently put this thought neatly when he said that while he could not now recollect what particular food he ate for dinner a month ago, yet that food went towards building up the wasted physical tissues; and so while he could not now remember the formulas and principles of the higher mathematics which he studied in college years ago, yet those formulas and principles helped to build up his mind and to make him intellectually the man he has become.

A State's welfare demands education.—Superintendent Cooper, of Texas: The stake of the parent in the correct education of his children is deep, but that of the State is deeper. The parent *may* be dependent on his children, but the State *must* be. The parent educates his children from motives of pride and benevolence; the State educates by the first law of its existence, that of self-preservation. Patriotism and philanthropy unite in fostering universal education, and utilize for this purpose the strong right hand of the law.

VI.—EVENING SCHOOLS.

Evening schools becoming more popular.—Marshall P. Hall, of Manchester, N. H.: We need a further development on the side of practical education, as represented in the evening schools and in certain departments of the high school. Increased interest in evening school work is reported from all our New England towns. These schools appear to be firmly established as an integral part of the common school system. As they are chiefly patronized by working people, and their attendance increases as the hours of labor lessen, their growth is a significant sign of the times. The ordinary evening school is capable of great development for good. Besides the usual instruction, advantage might be taken in its classes to teach the principles of our Government, and so counteract some of the political evils which exist in cities. Our own evening schools may be directly improved by the employment of better teachers, the introduction of other and more interesting studies, and by a more watchful supervision.

Evening schools for special instruction in subjects relating to the trades and industries are also increasing in number in manufacturing towns. Our classes in mechanical drawing are a beginning in this direction. They should be made free to every apprentice and artisan in the city, and enlarged until all applicants can be accommodated. Every man who attends them is made a better workman; he more highly respects himself and his calling; he is stimulated to invention and animated to become a master in his business.

VII.—GRADED SCHOOLS.

Graded schools do better work.—Superintendent Smith, of Tennessee: Better supervision can be had by having three men to supervise the entire district, and graded schools can be established—that is, schools can be established—where two hundred or three hundred children can be assigned to one house, and several teachers employed in the same school building, which will insure better work in every respect.

When the district directors fully understand the importance of graded schools, and begin the establishment of the same, we will make a grand advancement in school work.

One serious drawback to the efficiency of our schools is the establishing of too many schools in a district. We should have fewer schools, more children to a house, and longer school terms.

Grading of country schools.—Superintendent Lawhead, of Kansas: The sentiment that more and better work can be secured by a wise grading of our country schools pervades the best school men of all the States, and in States that have tried the plan it meets with much favor. * * *

In my opinion, the following are the objects that should be sought, with some of the advantages that would result from the adoption of a system of gradation for ungraded schools, namely: (1) An ultimate reduction in the number of classes; consequently more time could be given to each class. (2) More systematic work could be done, hence each pupil taught by example the necessity and practical benefit of system in every thing—a very important element. (3) Each pupil would realize that his advancement would depend upon the thoroughness with which he performed his work, therefore he would be stimulated to do everything in the best manner possible.

VIII.—HIGH SCHOOLS.

Secondary schools necessary to a complete system of public education.—President E. M. Turner, of West Virginia University: The great outcry is against inefficient teachers. They are called smatterers, empirics, mechanical in their methods, superficial in their attainments. Much of this criticism is well-founded; yet the teachers are not entirely to blame. The stream cannot rise higher than its source. With no opportunities for education higher than those furnished by the primary schools themselves, how can it be expected that they should be thoroughly qualified? Nine-tenths of the teachers of West Virginia have never had any advantages beyond those of the primary schools of their neighborhood, and they are simply perpetuating the evils of the system as they have learned them in the school-room. Institutes do something, but they can not be expected to do much toward raising the standard of qualification. The mechanical methods and superficial knowledge of teachers can not be got rid of until the teachers have better facilities for education. The primary schools must be lifted up by giving the teachers better instruction, and we can not give our teachers better instruction until we establish a system of higher schools, where, in common with all others who choose to attend, they may be better taught, and taught far beyond the subjects they are required to teach. It is a well-recognized educational maxim, that no teacher is properly qualified to teach a school of given grade until he has been thoroughly instructed in the next higher grade. The primary teacher in the vast majority of our schools must be also a grammar-school teacher, because he has pupils of all grades. Hence a system of high schools or secondary schools is necessary to the highest efficiency of the primary schools.

These secondary schools should be taught by the best instructors to be obtained. The teachers should all be liberally educated men and women. By "liberally educated" I mean educated in the true sense—not mere book teachers, mechanical in method and bound down by a superficial notion of the object and process of their work, but thorough masters of their profession, widely *knowledgeed*, thoroughly developed and cultured, master of their own persons and tastes, able to apply the most intelligent methods and develop the highest power and efficiency in the pupil.

But such teachers can come only from the highest educational institutions, the college and the university, where they have had the benefit of such instructions themselves. From these they may go down to the secondary or high schools and lift them up, and with them elevate the primary system. Then, a complete system of public education implies, of a necessity, a primary system, a secondary system, and a university or college at the head.

IX.—HYGIENE.

School-rooms should not be crowded.—Superintendent Chapman, of New Jersey: It should be quite unnecessary to point out the folly of placing a hundred or more pupils in a single room. These large classes are all of primary pupils, usually beginners. No teacher can do justice to so many pupils, and a dozen teachers can not take proper care of them, crowded as they are in small rooms. They not only fail to receive the instruction which is their due, but they contract habits of listlessness and inattention, which sadly interfere with their progress in after years. These results are serious enough, but when it is added that, as our school-houses are constructed, no child can remain in a room with so many others for any considerable time without seriously impairing its health, it should be sufficient to deter any school officer or any parent from consenting to such conditions.

X.—IRREGULAR ATTENDANCE.

Evil effects of irregular attendance.—Superintendent Patterson, of New Hampshire: In every town there are parents who, either too ignorant to appreciate or too selfish to re-

gard the interests of society or the welfare of their children, will, for the paltry value of a child's labor, or to gratify its love of play, become the conscious or unconscious agents in disturbing the discipline, breaking down the classification, and destroying the usefulness of schools by causing or allowing their children to be continually irregular in their attendance. The waste of school funds and the loss of intellectual and moral power to the community from this source are incalculable, for the good and the bad suffer alike from this unconscious criminality. As things are, it is impossible for teachers or school boards to remove the evil.

Value of high percentages of attendance.—Superintendent Powell, of the District of Columbia: "Figures," it is said, "never lie." Yet, in school statistics, if it is not known how they are obtained, figures may be the most deceiving rascals that ever told a tale. High percentages of attendance and punctuality on the face of them indicate advanced educational processes at school and high educational sentiment in the community, whereas they may have been obtained at the expense of the better and nobler impulses of the child, of the better and broader view of learning and growth, of other and equally valuable privileges afforded outside the school.

The teacher should know the value of sequence, continuity, and determined effort, and should seek to impress their importance upon the mind of every pupil, and should be estimated by his knowledge of causes of absence or tardiness rather than by the percentages made in either of these by his pupils.

The educating forces of the cultivated home and of society are so numerous and so valuable as auxiliaries for broadening and making practical the work of the schools that absence or tardiness occasioned by desire or opportunity may sometimes be excused in the pupil seeking these advantages. I would not encourage irregular attendance. Such is not the purpose of my writing. I wish only to emphasize the advisability and fairness of distinguishing between absence occasioned by carelessness of pupil or parent and that occasioned by opportunity and desire to profit by other valuable means of cultivation. Furthermore, I wish to emphasize the importance of recognizing the possibilities of the less fortunate of those who send to our schools, and to avoid, if possible, debarring from school privileges, even for a part of a week or a part of a day, any who may be detained from school occasionally to aid an indigent parent in the support of his family, or to assist a poor, hard-working, self-sacrificing mother in caring for an infant brother or sister for a part of the forenoon.

To know the cause of absence, to detect, encourage, and reform the careless and the wayward, to know and strive to reform the criminally careless and indifferent by all legitimate means should be encouraged in and made possible to our schools.

Children kept away on any sort of flimsy pretext.—Superintendent Buchanan, of Virginia: It is noticeable in the reports of many of the States that there is great irregularity of attendance upon the public schools. This is a great evil, and one for which it is difficult to provide an effectual remedy. Its causes are various. The fact that the public schools are free schools—charge no tuition fees—is doubtless one cause. When pupils enter a pay-school they must attend regularly or not get their money's worth. Irregular attendance on a free school entails no pecuniary loss. Hence, if parents are indifferent about their children's education, as unfortunately too many are, and know but little or nothing of the damage and annoyance of irregular attendance, their children are kept away on any sort of flimsy pretext.

In our cities stringent regulations in regard to tardiness and absence prevail, and the percentage of attendance compared with enrolment is very high. In the country greater irregularity is unavoidable, but it is believed that if boards of district trustees would adopt, with the advice and counsel of the school superintendents, regulations on the subject wisely adapted to the different conditions of country schools, they would be productive of good results.

XI.—LANGUAGE OF THE PUBLIC SCHOOLS.

Schools should be taught in the English language only.—Superintendent Cooper, of Texas: We have a large foreign element among our population. In some localities it is so strong in influence that it is able to enforce the use of a foreign language in the public schools. While we welcome thrifty and law-abiding citizens from every quarter of the globe, we should require that the children of our foreign-born citizens be taught in the public schools in the language of our laws and of our people. When natives of Germany, Sweden, Bohemia, or Mexico become citizens of Texas, they cease to be foreigners and become Texans, and their children should be trained to be in sympathy with our institutions. This will never be fully done so long as they retain as their vernacular the language of foreign and alien peoples.

Our common schools must be American.—Superintendent Kiehle, of Minnesota: The time has come when the State must give additional emphasis to the importance of the

common school as an ally of the State in training an intelligent and loyal American citizenship. * * * The first requisite, then, is that they teach thoroughly the English language as the language of the country. This is the language of our business and social life. It is the language of our history, our laws, and the only vehicle of American ideas. Other languages are necessarily un-American (not anti-American), carrying with them the traditions, associations, customs, and national spirit of other governments and civilizations; hence, if the youth of this country are to be Americans they must think and speak in the language of America.

They should be familiar with the great events of our history and the names of our patriots and statesmen whose courage and wisdom laid the foundation upon which we build.

All this should be the basis of an intelligent loyalty to government, a culture of political morality, and a sacred discharge of political duties as citizens at the ballot, as jurors, and in official positions.

It is necessary that public attention be called to this important service of the common schools, in view of the exceedingly large addition to our citizenship from foreign countries. The parents of foreign birth, with all their attachments to their fatherland, bring their children to America to share its liberties and the beneficence of its institutions. Their social and religious associations are among friends of their own language, and the common school is the only American institution within the reach of their children.

I am of the opinion that greater care should be exercised in protecting our common schools from foreign influences. Localities have come to my notice in which the schools have taken on a style of speech and instruction that is, to say the least, not American. The English language is not intelligently spoken by teacher or pupils; American history is never taught, and American literature is carefully excluded. The songs of our country are never sung, and the flag of the nation is unnoticed.

XII.—LIBRARIES FOR SCHOOLS.

Importance of public school libraries.—Superintendent Morgan, of West Virginia: The establishment of libraries in public schools or under the control of public school authorities, to be used in connection with the work of public schools, is an educational question of increasing importance. There are two facts which seem sufficient grounds for the establishment of these libraries. The first is the evil influence of pernicious literature, everywhere so abundant and made so seductive and attractive to childhood, and which the public library, accessible to the children of the public schools, must become the most effective means in combating. The second reason is the educational value of public libraries, not in the general sense meant when speaking of libraries, but as a great supplementary factor to the public school itself. The reading habit and the taste for good literature are matters of cultivation, and the formation of both should be commenced in childhood. An inquiring spirit and love of good books must form the best part of every child's education, and the public school and the public library, the great factors in popular education, should therefore work together.

When the time shall have come to pass that every child in the public schools shall have the privilege and encouragement of the school library, popular education will have taken a long step forward.

Teachers should be required to attend to the libraries.—Superintendent Hoitt, of California: In my opinion no better use can be made of a part of the school money furnished by the State to each district, than in expending a small portion of it in the purchase of suitable reference and library books, provided always that teachers are employed who will encourage and direct the proper use of them.

Better care, in many cases, should be taken of the school libraries and school apparatus. When a teacher enters upon his work, at the beginning of the school term, the clerk of the district should take his receipt for all library books and apparatus on hand, and no requisition should be drawn by the county superintendent for the salary of the teacher, for the last month of his term, till such teacher files with the county superintendent the receipt of the clerk of the district for all library books and apparatus which were placed in the care of the teacher at the beginning of the term, showing that all such articles and books have been returned to the library in good condition, allowance being made for wear and tear.

School libraries Americanize the children of foreigners.—Superintendent Kiehle, of Minnesota: The test of one year fully sustains the claims urged for the passage of the law. Where the people have been interested and have ordered books for their children the effect has been wonderful. I am informed of counties, largely Scandinavian, in which the districts are generally supplied with libraries. The effect of all this is that these children are rapidly becoming interested and informed in American history and literature. That means they are becoming Americans.

XIII.—MANUAL TRAINING.

Manual training does not retard the progress of the pupil.—Superintendent Chapman, of New Jersey: It is the united testimony of the teachers that the pupils who attend the industrial school retain their places or standing in their respective classes. No falling off in any particular has been noted. On the other hand, the change of work and the stimulus to excel in this particular kind of knowledge has rather added to the work the pupils are doing on their regular lessons. The fact that a dull boy has shown his class that he can do something has tended to elevate the standing of that particular boy, not only in his own estimation but in that of his comrades.

It enables the pupil to secure the larger number of, and at the same time clearer impressions from, the multitude of objects with which he comes in contact, and which are the basis of his thoughts. It increases the expressing power of the pupil. It develops habits of method and exactness; trains the eye to appreciate form, and trains the hand to represent and create form in accordance with established principles, and in training the eye and the hand, the system cultivates the brain.

New methods not always improvements.—Superintendent Brumbaugh, of Huntingdon County, Pa.: The intelligent school friend will remember that change is not always improvement; that retrogression is quite as possible as progression. Every new device, therefore, that comes pressing for attention must be carefully considered before it is accepted. There is a growing tendency to demand from our schools that which they were never designed to give, that which, under existing circumstances, they cannot give. It is not true that time spent in studying that which has no direct bearing upon the probable future business pursuits of the child is wasted time. It is not true that those branches which are apparently and generally regarded most practical, are the ones the child may study with most profit. Let it not be forgotten that cultured minds, filled with knowledge and skilled to application, will adapt themselves to any ordinary business pursuit more readily than those minds to which only utilitarian instruction has been given. Rather than demand manual instruction at present in our schools, let us demand more thorough mental training. What is needed is intensity, not utility; mental concentration, not physical application. His whole future touches the manual and quickens it into all needed activities; the mental is given in the school if at all. Let school be an all-sided preparation for complete living, not an apprenticeship for shop or factory. So far as manual training has pedagogic value embrace it. When it has mercenary motives it is fatal to incorporate it. "No man liveth by bread alone."

Highly endorsed by the supervising principals of Washington City.—Superintendent Powell, of the District of Columbia: The estimate given to these manual training exercises by those whose schools were affected is found in the various reports of the supervising principals. The consensus of opinions there found, given as they were after a year's observation and practical experience, with all the disadvantages that such training can possibly offer to a school system, is to my mind the strongest argument in favor of manual training that I have ever heard or read, and my investigation of this subject has been wide and thorough.

Manual training in the public schools advocated.—Z. H. Brown, superintendent of city schools, Nashville, Tenn.: The educational forces are at present being directed towards manual training, or industrial education. As is always the case, any new departure from that which has been so long established is met by strong opposition, and only by slow degrees does this opposition lose effectiveness. Anything so deeply rooted in the affections of the people as are the public schools will, when in seeming danger, awaken alarm. There are those who are unwilling to believe it possible for manual training to be carried along *pari passu* with the ordinary school curriculum; others claim they go hand in hand, each strengthening the other. There is still a third party who think it best to have the boys attend the training school in the evening after regular school hours. There is a total misapprehension on the part of the general public as to what is expected of the manual training school, and how it is to be attained. I can not better give my own views than to quote from another:

"* * * The demand to-day is not to lessen the intellectual culture which the schools are giving, but simply to add to it the culture of the eye and hand; not to fit children for any particular trade, but to qualify them to be intelligent workmen in any vocation. The idea which prevails that industrial schools are trade schools is as ridiculous as it is absurd. What advantage would there be in teaching a boy to be a shoemaker? Would he peg and stitch in competition with the steam power that is employed in the manufacture of shoes? Why teach a boy to be a blacksmith? Could he shape and weld in competition with the steam hammer? The teaching of trades is outside of the question of industrial education. The proposition is to amend the curriculum so that the graduate of our public schools shall not only have a fair literary education, but that he shall also be able to draw, design, work to plans, and handle tools."

XIV.—MORAL TRAINING.

Moral training should be given in the schools.—Superintendent Brumbaugh, of Huntingdon County, Pa.: Discipline is, and to my mind must continue to be, a matter of great importance. The State reasonably expects from the school, as a product, thoroughly disciplined citizens. The mere importation of knowledge or, indeed, the unfolding of a mind is not the leading result demanded by the State. What is of paramount value is training, discipline, correct habits, not merely of thought, but of action. There is, therefore, a moral demand made upon teaching. The school is a power which will be felt in the government of the future. This power needs more than awakening; it needs high intelligent direction. The schools must send out boys and girls whose habits of thought, system of business, and uniform adherence to right have all been awakened, stimulated, and exercised along the proper channels of life until the State may safely repose in them full confidence. Thus only may we meet the expectation and reasonable demands made upon us. Our instruction, therefore, needs to be so modified as to include careful training in civics and in the higher principles of morality.

XV.—NATIONAL AID.

National aid needed in Georgia.—Superintendent Hook, of Georgia: The colored people show great anxiety as well as aptitude to learn, and it is to be regretted that the noble effort of our State has not been backed up by the General Government by the passage of the Blair bill. Every consideration, as it seems to me, of justice, humanity, and right demands such action on the part of the National Government in behalf of these people, upon whom that Government has cast such important responsibilities.

National aid to local efforts advocated.—Professor Chambers, editor of the Progressive Teacher, New Orleans: No one believes more firmly than I in the wisdom and justice of that measure now pending in Congress known as the Blair bill. The same principle by which a State government is interested in the welfare of every one of the citizens composing its counties and cities holds equally as good when we say that the General Government should be interested in the citizens of its constituent States. But while I believe help from the General Government to be good, I also believe that help from the State is better, and best of all is that *self-help* that township, district, or community invokes when it levies its own special tax, expends it at home, and is directly interested in the expenditure.

Needed to overcome illiteracy in Alabama.—Governor Seay, of Alabama, in his message to the Legislature, November 3, 1888, says: The great burden which has rested upon finances, and even more weightily upon our consciences, has been the cost of public education. But for this increasing burden our affairs would indeed be easy, and yet very few thoughtful men will say that the policy of the State had not been both wise and beneficent. * * *

The census bureau of 1880 reports in a voting population of 260,000 there are about 121,000 electors who cannot write; and that there are within the borders of this State, in a total population of 1,262,000 souls, about 371,000 over the age of ten years who can not read.

This burden of illiteracy, which we have been stooping under, was largely imposed by the Federal Government, which by a paramount force debased our suffrage and destroyed our property. This edict more than quadrupled the illiteracy of our citizenship and reduced our property from the grand total of \$650,000,000 to \$150,000,000. The further immediate effect is felt by a division of the tax money from this narrow fund between the children of the two races in the State. Therefore it remains clear to me that the Federal Government should at least divide the burden which has been imposed. But in the mean time we should continue in the path which our predecessors have so bravely followed, and we should make an additional appropriation from the State treasury to the public schools of the State. * * *

It is not claimed that this policy should be pursued merely because it comports with the dictates of enlightened philanthropy, though certainly it should be no cause of challenge to its expediency that it is in harmony with it.

That "the Prussian school-master won the battle of Sadowa," is the opinion of one who is neither a sentimentalist nor a humanitarian, but a grandee and a prince, a severely practical soldier and an intense aristocrat. * * * It is unsafe for us, however, to rely either on Federal aid, which will probably be temporary, or on an appropriation from the general funds in the State treasury.

The South needs assistance as never before.—Superintendent Palmer, of Alabama: Certainly if there ever was a time in the history of the country when Federal aid should be given to education, that time is the present, when the surplus in the Treasury has so contracted the circulating currency as to threaten the destruction of the commerce of

the country and to seriously damage every business enterprise. This surplus should be, must be, returned to the channels of trade and to the people from whom it has been wrongfully taken, because not needed for the proper administration of the Government; and for what purpose can it be, is it more likely to be, appropriated that would benefit the people—the people of the South—especially of Alabama—and be restored to the channels of trade more speedily than by appropriating it to the cause of education in the several States?

National aid as given in 1837 desirable.—Governor Taylor, of Tennessee: If, after the General Government shall have discharged all its current obligations and met every demand; if, after this, there still remains a surplus of money in the Treasury not applicable to the national debt, because not yet due, then, I said, the appropriation of such surplus for educational purposes, stripped and freed from every possible condition of Federal supervision or control, would be an inestimable blessing to the children of the State. I said, in substance, and say now, that such a surplus under such circumstances, and unburdened with conditions prejudicial to the local government of the States, could not flow back to the people (to whom it belongs) through a better channel than the school room. I want to be understood. We do not want Federal aid to education unless it is appropriated to the State of Tennessee, to be used under her own laws, without any Federal control whatever. We want it as we received it fifty years ago, when "Old Hickory" Jackson was President of the United States.

XVI.—PRIVATE SCHOOLS.

Private schools detrimental to public schools.—Superintendent Williams, of Utah: While from a casual view it may appear that no disadvantage to the district schools is likely to result from their [private schools] establishment and successful progress, yet it seems to me that in this very condition is found an element that must operate to the detriment of the public schools, tend to hinder their advancement, and lessen their influence. * * *

If the public schools are not made worthy of the support of the public without distinction of party, it may be naturally expected that the influence, whatever it may be, of those not patronizing them will be exerted against their maintenance at the public expense.

XVII.—PRIZES.

Prizes stimulate the wrong pupils.—City School Superintendent Bettison, of New Orleans, La.: The system of awarding prizes has often been discussed, and generally condemned. The offer of a prize is a powerful stimulus, but it stimulates those only who need no such incentive; it deprives them of the rest and recreation their nature requires; it often creates the bitterest heart-burnings, and even robs the contestants of some of their noble appreciation of learning for its own sake, which, before the offer of the prize, was growing with their growth.

The system of marking recitations and reporting the relative standing of the pupils has its advantages, though it is often much abused. If a pupil knows that he can not be head, he still would rather be tenth than eleventh, and the class receives a moderate stimulation throughout.

XVIII.—PUBLIC SCHOOLS.

Development of the school system.—Superintendent Draper, of New York: The public school of to-day is a public school in an entirely different sense from what it was two hundred, one hundred, aye, even fifty years ago. Then it was maintained for the well being of the child, now for the safety of the State. Then it was supported by private contribution; its advantages were bought and paid for like any marketable commodity; or it was maintained as a public charity for the help of the poor. Now it is supported by the entire people, through a general tax upon all interests, upon the ground that it is a thing essential to the promotion of good citizenship, to the protection of property, to the safety and preservation of the State. The last vestige of personal support and personal control, as well as the last taint of charity, has disappeared.

Public schools must still be improved.—Superintendent Morgan, of West Virginia: The educational systems and institutions of to-day are the results of long years of growth, having passed through many changes in reaching their present state of efficiency and completeness. Although in every way more perfect and efficient than those of any preceding age, still the educational systems of to-day have not reached their highest degree of efficiency, nor are they to be considered as finished products. In obedience to the great law of progress, they must continue the work of change and improvement to meet the demands of the onward march of civilization. Marvelous as has been the growth of popular

education, the public school system is, comparatively speaking, yet in the first stages of its development and usefulness. It must go forward with the work of improvement as public sentiment becomes more liberal, stronger, and more enlightened. Many obstacles that now clog the wheels of progress must be removed, some by the force of public sentiment and some by legislation. The educational interests of a people are matters of the first and highest consideration.

The public school system was established because it is necessary to the public welfare. Any failure, therefore, to provide for its highest efficiency, is a failure thus far to provide for the public welfare. Through the agency of the public school every child is expected to receive that elementary training which forms the necessary qualifications for future citizenship and usefulness, and, so far as practicable, the State should see that every child does receive the advantages of this elementary training; at least, the State should see that no child is prevented from receiving these advantages which have justly been called its birthright.

Public schools awaken a desire for knowledge.—S. G. Pyle, school superintendent of Tyler County, W. Va.: It is not merely the information and knowledge gained in the short stay of boys and girls in our free schools that educates them, but it is the inspiration there given to learn more, and the avenues and highways opened and the directions pointed out by the teacher, to which a higher, more thorough and practical knowledge can be gained through individual efforts and personal sacrifices.

Public schools should have public interest.—Superintendent Moody, of Idaho: Our public schools are the product of public sentiment, and until the people are aroused to a point where their interest will become active in school matters and in educational affairs little can be done for the improvement of the school system. In communities where the majority of the inhabitants never enter the school-room, where the conduct of school matters is left to the control of irresponsible individuals who receive no pay and too often are too ignorant to perform the simple yet responsible business of the office, the task of arousing a proper interest is almost hopeless.

A cause of opposition to the public schools in the South.—Superintendent Finger, of North Carolina: A prominent ground of opposition to public schools in this State, and in the South generally, is the burden cast upon an already impoverished white population to educate the negroes, who pay so small a proportion of the taxes. This ground of opposition is intensified by the belief that is more or less prevalent that education spoils the colored people as laborers, to their own damage and the damage of the white people, who own almost all the lands. It is said that when you "educate a negro you spoil a field hand."

On this point it may be said with truth that the negro's sudden freedom and citizenship, for which he was unprepared, the privileges of education and all the new experiences he had during and soon after the War, including much bad leadership, completely turned his head, so to speak. Forced labor to him had, during slavery, been his peculiar hardship and curse. In his ignorance he thought the new conditions, and especially the privilege of education, were to relieve him from this curse of labor. The old negroes went earnestly to work to learn to read. They failed, but attributed their failure to lack of early opportunities. But they resolved that they would secure education for their children, and, with this special end in view, *the escape from manual labor*. The present generation of younger negroes has been educated too much with this purpose in view, and, because of this wrong idea, it is true that a smattering of education to many of them has caused idleness and laziness.

Schools of different grades should be established.—Superintendent Cooper, of Texas: The schools should be classified into primary, intermediate, and high schools. The primary schools should be limited to the subjects required by law to be taught in every public school—spelling, reading, writing, grammar, and composition, elementary arithmetic, geography, and primary history, including elementary instruction in the duties of citizenship. Forty-nine fiftieths of all our public schools belong properly to this class. The intermediate schools should be located by the county superintendent and boards of trustees acting together, so that not more than one should be established in each justice's precinct, and should be allowed to give instruction in all the subjects of the primary school and such other subjects as are required for admission to the high school.

A high school should be selected or established in each county by the county commissioners' court, with the approval of the county superintendent, to which any pupil of proper qualification within scholastic age, resident within the county, should be admitted free of charge.

Necessity for good common schools.—Superintendent Rice, of South Carolina: Our poverty prevents many children from leaving home, and the great number must be educated in the local schools. The most important school in the State, to the ordinary citizen, is the one at his door, and he should spare no pains nor expense to make it so good that

the children of himself and neighbors may receive first-rate common school training therein.

The people should take an interest in the schools.—Superintendent Logan, of Montana: The public is the most powerful agency, if properly employed, in working out the salvation of the schools, for they should control and be held responsible for the present, and, to a certain extent, shape the destiny of the future.

Yet we find them often relegating to teachers and other officers influences that they alone should control.

No matter how competent the teacher, or how zealous and mindful of interests are boards of trustees, if the public withhold their sympathy and support and allow their interest and vigilance to relax, just in that proportion will the schools suffer and progress be impeded; and the extra duties thus imposed upon teachers become barren of the best results.

They too often consider their work finished when taxes are paid and imposing structures are erected for school purposes. This is a great mistake, for schools will not successfully run themselves.

Suspension of pupils.—Superintendent Draper, of New York: May children be suspended or expelled from the schools? I have no doubt about the right of the school authorities to deprive children of the privileges of the schools. It can only be done for good and sufficient reasons. A child with an infectious or contagious disease; a child of such utterly depraved morals as to be beyond redemption and dangerous to others; a child of such viciousness and incorrigibility as to be beyond control; a child who comes with such irregularity as to make his attendance only valueless to himself and detrimental to the school, may unquestionably be put out of the school. But the cause must be a grave one. The right to attend the schools must not be abridged except for reasons which tend to the destruction of the school itself. The suspension of school privileges can continue no longer than the reason for it exists. If the child comes ready to abide the discipline of the school, and in such condition that his presence is not injurious to the school, he must be admitted.

XIX.—REVENUE.

Local taxation preferable.—Governor Seay, of Alabama, in his message to the Legislature: The intelligent tax-payer does not complain so much at the rate of taxation as at the mode of expenditure of the tax money. Where the tax is a local one, and is raised and expended in the immediate view of the tax-payer, and for a local purpose that he deems valuable for his community, it is paid readily and with alacrity.

XX.—SCHOOL-HOUSES.

Importance of good school buildings.—City Superintendent Babcock, of Oil City, Pa.: Pleasant, well-ventilated, and well-lighted school-rooms are not only a convenience, they are a necessity to good work. This has been demonstrated in our experience. In the new rooms the work was far superior to that accomplished by the same pupils in the rented rooms, which, though the best that could be obtained, are ill adapted to school work. A community can make no better investment than building good, even beautiful, school-houses. However good otherwise the school may be, the effect upon the pupils' characters and tastes of a rude, barn-like school-room should not be considered as the result of a wise economy.

School-houses should be built with reference to future needs.—Superintendent Williams, of Utah: Where a population has become permanent, and every reasonable probability is that it will gradually increase, the erection of a school building should be one of great concern to the people, and it should be built with reference to the future rather than the present.

There is no reason why buildings for school purposes should not last through the education of several generations of children, and with that view the structure should be planned and erected. To do this, however, involves necessarily the raising of a considerable sum of money, a burden that would be borne with difficulty if imposed at once, or within two or three years. To avoid the imposition of so heavy a burden within a brief space of time * * * provision should be made by law whereby districts might issue bonds, and thus raise an amount of money adequate to supply such structures, with a provision for levying a light tax annually to gradually discharge the indebtedness.

School-houses to be used only for public schools.—Superintendent Higbee, of Pennsylvania: It certainly is a plain principle of law that corporate property must be used solely for corporate purposes. Otherwise all the school property of the Commonwealth might, by a simple vote of directors, be devoted to any purpose they saw fit.

In the syllabus of a decision rendered by Hon. George W. McIlvaine, chief-justice of the supreme court of Ohio (35 Ohio, f. 143), it is held first: That "boards of education are invested with the title to the property of their respective districts in trust for the use of public schools, and the appropriation of such property to any other use is unauthorized," and second: "That a lease of a public school-house for the purpose of having a private or select school taught therein for a term of weeks is in violation of the trust; and such use of the school-house may be restrained at the suit of a resident tax-payer of the district."

In rendering the decision this able judge says: "The questions in this case relate solely to the power of a board of education to appropriate the public school-house of its district to private uses, or indeed to any use other than public schools." After citing the Ohio enactment for the reorganization and maintenance of common schools, which defines the powers and capacities of school directors in language almost the exact parallel of our enactment above quoted, he says: "By virtue of these sections, all public school-houses are vested in the boards of education in trust for the use of the public or common schools, and the appropriation of them to any other use is unauthorized and illegal."

In the case submitted to us, it is stated that the board of directors have rented or leased a public school building for the use of a *parochial school*, where the peculiar dogmas and usages of a particular church are promulgated and taught, or where only a certain distinct class of children are admitted. In this case, granting the statement of facts, there is not only an unauthorized violation of trust, but a seeming indifference to what is explicitly forbidden by the Constitution of the Commonwealth itself.

A school is not sectarian because taught by a minister, or priest, or any church official. But a school controlled or managed in the interest of any particular church organization, upholding its peculiar confession and ecclesiastical practices, and used for any class of pupils, exclusive of others, is certainly sectarian. It does not, in any sense, belong to our system of public schools. On the contrary, no money raised for the support of the public schools can be used for its support without a direct violation of the Constitution. Were school directors permitted to lease our public school property thus, at their own will, for the use of parochial schools, the ecclesiastical convictions of the directors could turn our public schools into as many different kinds of church schools as there are different denominations in the Commonwealth. The point is too plain to require any further explanation.

Some may be willing to grant that directors can allow school buildings to be used out of school hours for such incidental purposes as singing schools, debating societies, etc., without justifying an injunction of restraint, although there has been a decision in Connecticut, by a divided court, even against this (see 27 Connecticut, f. 499); yet here the school building as alleged is used, not incidentally, but exclusively for a purpose not contemplated in the law and forbidden as regards statutory schools by the constitution itself. The very fact that the school building is rented, or leased, or granted for the temporary use of a school is sufficient evidence that its essential corporate use is perverted; for public schools do neither lease, nor rent, nor ask for the temporary use of that very property which, by public tax, has been purchased, and is to be held in trust for their permanent use alone.

XXI.—SUPERVISION.

The best men should be chosen for county superintendents.—Superintendent Hoitt, of California: No officer in the State is of more importance to the community in which his duty calls him than the county superintendent of schools. He should be required to give his whole time and attention to the schools of his county, and he should receive adequate compensation for the important services rendered and the responsibility assumed. He supervises to-day the training of the citizens of to-morrow. The people expect him to be, and he should be, a man capable of leading, directing, encouraging, broadening, strengthening, and elevating the character of the community in which he lives.

Corporations provide for supervision.—Superintendent Thompson, of Arkansas: The State should manage her public interests on as sound business principles as private affairs are looked after by individuals who invest capital from which they expect large dividends. Neither individuals nor corporations invest money without providing for careful and intelligent supervision of such business by agents, skilled each in his particular line of work. Our free school system is a public enterprise, supported by the State and local taxation, by which the State hopes to secure a more intelligent class of citizens than we have at the present time. * * * Considering the large fund invested, and the interest the State has at stake, it appears vastly important that the most careful and intelligent supervision should be secured; a supervision intelligent, vigilant, and active in every detail of this great work.

Necessity for well-paid supervisors.—Superintendent Logan, of Montana: The necessity of thorough supervision over the public school system has demanded almost universal recognition, as nearly every State and Territory at present has general as well as some system of local supervision, either county or district, and wherever such supervision is lacking it is shown most conclusively by authenticated reports that the absence of it is inimical to the best interests of education.

* * * * *

Without county supervision I believe there can be no uniformity of work or concentrated action. You ask, then, where lies the difficulty? I answer in the law that creates an office without prescribing qualifications or providing a salary that reaches above the dignity of a mere stipend or pittance. The salaries of this Territory range from a minimum of three hundred dollars to a maximum of one thousand dollars per year. Now these are false ideas of economy, and threaten our future welfare as a people.

Now let me ask, can we reasonably expect to avail ourselves of the services of energetic and scholarly persons, thoroughly qualified by educational and natural endowment to do this work, or shall we not rather be compelled to procure those whose services are not worth more than this amount in other fields of less responsibility, or others who, if qualified, can afford to give but a little of their time, while their greatest and best energies are employed in more absorbing and profitable channels? How would we consider and what would be the result if a business man employing hundreds of skilled laborers should place as superintendent over his business one having a limited knowledge of the work and at a salary of one-half or one-third paid the average workman?

Duties of a county superintendent.—Superintendent Rice, of South Carolina: The humblest citizen has the desire and is entitled in this Christian land to claim that his children shall have the protection and guardian care of the most capable officials during their brief school life. We want a real system, vital in all its parts, not one elaborate on paper and defective in every point of practical development. A commissioner should sympathize with and stimulate the teachers. He should eradicate the barnacles that infest the profession. He should bring the intelligent and conscientious into associations for common improvement. He should disseminate the discoveries of science as applied to men, methods, and machinery. He should educate the people and teachers into active co-operation and intelligent sympathy, and thus bind them into a harmonious whole—a real system—all its elements under his supervision. This and nothing less is the measure of the man who should fill this important place. This principle of constant and patient inspection is inherent in any successful co-operation. Its presence and exercise mean life; its absence or want of exercise, death.

Importance of county supervision.—Superintendent Kiehle, of Minnesota: The importance of the office of county superintendent is my reason for so frequently recurring to it and for suggesting every possible expedient to increase its efficiency. Besides examining teachers and issuing all certificates, the superintendent is in position to promote capable teachers by his recommendations, and to exclude those incapable from responsible positions. He can in his visitations make valuable suggestions to teachers for the improvement of their instruction, and to school officers for the improvement of school facilities in building, apparatus, and libraries.

* * * Because, therefore, of the importance of this office, I must again call attention to the serious embarrassments which superintendents of counties suffer in being chosen at popular elections at times when all the agencies of party prejudice, personal enmities, and personal ambitions conspire to obscure a sound judgment and prevent a careful selection of an officer who is thoroughly competent to discharge the duties of the office. As a result, efficient superintendents are often displaced when most useful, and the best are greatly tempted to secure themselves in their positions by methods more political than educational. All these things detract from the character of the position, and often create artificial barriers to usefulness.

* * * The remaining suggestions I have to make are: (1) That the election of county superintendent be held at a time separate from the usual time of the election of other officers. (2) That some evidence of educational qualifications be required, as that of a first-grade certificate.

Influence of the county superintendent.—Territorial board of education of Dakota: It may be safely said that the county superintendent is the "master-wheel" in our system. It is a well-established pedagogical principle that "as the teacher is, so is the school." None the less true is our paraphrase of it: "As the county superintendent is, so are the schools" of his county. He affects them at every point. His influence in educational matters is coextensive with the limits of his county. The energetic, progressive, intelligent, sympathetic, educated county superintendent is a great blessing. The man of immoral habits, loose manners, and ignorant of his work is no less a curse.

Special need of supervision for county schools.—Superintendent Morgan, of West Virginia: Competent supervision is a matter of prime necessity in the management of our

public schools in order to secure the best results. The State has done but a part of its duty when provision has been made for the levy and collection of a school tax, the building of school-houses, and the employment of teachers. The qualified teacher should be placed first; next in importance comes competent supervision as factors vitally connected with the advancement of popular education.

The work of teaching suffers more than all other professions from indifference and incompetency. Men and women seek an entrance to the ranks of educational workers, not because of natural or acquired fitness, but because it is the best thing they can do for that particular time, intending, as the majority do, to enter other fields of labor as soon as opportunity offers itself. Fully twenty per cent. of the entire enrolment of teachers in this State leave the work each year. The statistics of other States show similar conditions. It also frequently happens that when two terms are taught in the same year, the two terms are taught by different teachers. It is unnecessary to remark upon the great waste and confusion that result from this condition of things—waste of time, effort, and money.

The importance of securing trained and competent supervision has become fully recognized in the management of all city public school systems, and this fact is so well understood that no expense is spared to secure the best talent and qualifications. A slight examination will show that the ungraded schools suffer more from frequent change of teachers and shorter terms of school than the graded schools of towns and cities, and yet the ungraded schools receive the least amount of supervisory care and direction, and generally that of a quality far inferior to that employed in graded schools. The ungraded schools stand in greater need of supervision than the graded schools, and the best method of securing supervision for these schools stands to-day as an unsolved problem. While it is not likely, for very obvious reasons, that the supervision of our ungraded schools can be brought to that degree of perfection and efficiency that now characterizes graded schools, yet the office of county superintendent can be so enlarged in scope and functions as to improve greatly the quality and amount of supervisory attention now given the ungraded schools.

County superintendency proves advantageous in Texas.—Superintendent Cooper, of Texas: The experiment of county superintendency which has been made during the past two years has demonstrated conclusively the superior efficiency of the system and justified the hopes of its friends. The school term has been essentially lengthened in nearly every county which has adopted superintendency, although the reduction in the per capita was expected to reduce the average term. The law providing for optional county superintendency was passed in the spring of 1887. * * * The average increase in the school term in the counties having adopted it is nearly half a month, although the apportionment was reduced 25 cents per capita. But the increase in length of school term is one of the least of the benefits which have followed the adoption of county superintendency in some of these counties. The teachers have been aroused, the schools have been classified, the interest of the people has been directly enlisted, and the children have been taught—not merely kept in school-houses. Effective supervision is essential to an efficient system of public schools, and opposition to county superintendency is either conscious or ignorant obstruction to economy, efficiency, and progress in our public schools.

School trustees should be progressive men.—Superintendent Logan, of Montana: The office of trustees is one of the most honorable and responsible positions connected with our schools, for to them are entrusted the honor, reputation, and welfare of the district, as well as guardianship of the youth. Such responsibilities require responsible men.

Boards of trustees should be composed of the representative men of every community. Public spirited, progressive, and intelligent citizens are and should be found by the office. It is important that such persons should be elected, as it is essential that only the best teachers should be employed.

XXII.—TEACHERS.

Necessity for teachers of high character.—Superintendent Hook, of Georgia: The teacher is, next to the minister of God, the most important figure moving on the stage of our secular and social life. He trains the young minds and hearts, and thus becomes the first lieutenant of the parents of every home in the land. His character should be without stain, his intelligence should be large, his temper and manners kind, courteous, and genial, and his bearing fully equal to the behests of the high and responsible duties imposed upon him.

Relation of teacher and pupil.—Superintendent Draper, of New York: The teacher has a legal right and is vested with legal power and authority to maintain order. If order is the first law of Heaven, it is none the less so of the school-room. It is of the first and highest importance. The law understands this and clothes the teacher with author-

ity adequate to secure it. If with this authority the teacher can not maintain order and exact an immediate and unhesitating obedience to his reasonable commands, he had better surrender his commission and go into some other business, and not be long about it. If he can not do it without brutality he had better abandon the attempt to do it at all, for the law will no longer sustain him in doing it that way. The law does not forbid corporal punishment, but the better opinion of the people is unquestionably adverse to it. Any severe infliction of it which amounts to brutality is an assault in the estimation of the law, for which the teacher is both civilly and criminally liable. I have sometimes thought that teachers are liable to be misled by the frequent use of the phrase *in loco parentis*. The teacher cannot, and he ought to know that he does not, stand in the exact relationship which the parent sustains to the child. That is impossible. It is impossible because nature is against it. The law will not permit a teacher to punish as severely as it will a parent, because the law is humane and recognizes the fact that the parent has in his breast a feeling for the child to which the teacher is probably a stranger. The law will guard more jealously the treatment of the teacher towards the child than it will that of the parent towards the child. The law clothes the teacher with power to exact and command obedience, but it expects that he will be of such a character, of such natural attainments, and of such qualifications and experience that he can exact and maintain obedience and order in the school-room without resorting to measures that are overharsh. The tendency of the age undoubtedly is to debar vicious and incorrigible children from the privileges of the schools or to provide for them in schools arranged for their separate use and with special reference to their care and discipline.

The teacher can require that pupils who pretend to come to school shall come with reasonable regularity. Can a child come to school but one day in a week, can he come only on alternate days, can he come an hour after the sessions have commenced, can he leave in the midst of daily sessions, only because the child knows no better and is allowed at home to follow his own inclination, or because the lawless parent wishes him to be so irregular? I answer no, with much confidence in my position. The school is free to all. It is the common right of all. Each must, however, use his privileges in a way which will not injure his neighbor. If you are to permit such irregularity and lawlessness in one case you must do it in all cases, and any such position would lead to the overthrow of the public school system. And so I say unhesitatingly that it is within the province and it is an essential part of the duty of those who are in charge of the public schools to exact prompt and regular attendance, so far as attendance can be prompt and regular, having in view the nature of the home circumstances which ought to be taken into consideration.

Influence of the teacher.—City Superintendent Shelley, of York, Pa.: The teacher must himself be the embodiment of what he would have his pupils become. His motives of action will inspire lofty motives in the young souls entrusted to his care; or, on the other hand, the low plane of the teacher's intellectual and moral life will be the certain prelude to the mental dearth and moral degradation of those under his instruction and influence. The teacher should prepare himself intelligently to direct the observations of pupils in the realm of nature as well as to lead them to appreciate and enjoy the good in literature. With teachers who find their highest enjoyment out of school hours in preparing themselves to do better and more thorough work the schools must prove a success.

Professional teachers should be employed.—Z. H. Brown, superintendent of city schools, Nashville, Tenn.: The services of most estimable young men have been secured as teachers, and had they remained they would have been valuable accessions to the corps, but their term of service has been too short. It is unfortunate for the school that these positions should be held by young men who are simply preparing themselves for some other profession rather than that of teaching. However promising they may be, and however well they may have stood in the college from which they bear a diploma, they are but novices in the business of teaching, and the school must suffer, at least till they acquire some professional experience. Such policy as will secure a greater length of service, and hence a greater degree of permanency, in these important positions will contribute much to the successful training of the high school pupils.

Teachers should be well paid.—J. M. Satterfield, school superintendent of Marion County, W. Va.: One great drawback in the profession of teaching is the low salaries paid. One who makes a success in teaching will also be successful in other callings; hence when teaching fails to compensate him he will seek employment more remunerative, and the consequence is, the inexperienced teacher is constantly taking the place of the experienced. Too many boys and girls—*children*—are trying to teach school. A teacher of twenty years' experience is offered no better pay in the common schools than one who has never taught, provided their *certificates of scholarship* happen to be of the same grade. A teacher should be paid according to what he does and not according to the amount he knows.

The success of a teacher determined in the school-room.—F. R. Brace, school superintendent of Camden County, N. J.: It is too true that many who enter the teacher's profession have only a slight conception of the teacher's work, and so fail in the outset. Some find out their unfitness and fall out of the ranks, and some remain to become tramp teachers, staying only a year or a part of a year in any school. It is also true that some of those who take the highest standing in our normal schools and colleges, and wear the highest honors, are complete failures in life. Some who are sent out to teach, clothed with the authority of a normal school diploma, are utterly unqualified to take charge of a school and teach the pupils, while some that have failed to get their diplomas have become first-class teachers.

Preparation of teachers.—President Sheib, State Normal School, Louisiana: The teacher must have completed her preparation when she enters the class-room. She is there to instruct and train, and the object and means by which it is to be attained must have been considered beforehand.

Moral character of teachers.—President Sheib, State Normal School, Louisiana: It is the man or the woman, not the method or the disciplinarian, that teaches the most serious lessons which the child has to learn. It is this teacher who appears before the class at the same moment as a guardian, as instructor, as friend, as guide, and as the model man or woman whose truth, sincerity, and purity are worthy of imitation.

Education has for its object the moral being as well as the intellectual one. * * *

The very idea of benevolence and justice revolts against a system which wilfully, or as a result of criminal negligence, entrusts the conscience and the character of the child to the care of a teacher whose mind is poisoned and whose heart is bad. This evil communication is all the more dangerous because to the child the teacher is a guide and a model.

Young persons should not be employed.—Town Superintendent Matthews, of Cornwall, Vt.: I think that the law ought to require that all teachers should be at least eighteen years of age. There are too many young teachers who not only have had no experience in teaching but do not know how to govern themselves, much less their schools.

Town Superintendent Guild, of Enosburg, Vt.: I think there is need of a law limiting the age at which one can secure a certificate for teaching. In some schools there is a strong tendency to hire young teachers in order to save a little in wages.

Older teachers would have a maturer judgment for the work, would demand higher wages, and the larger wages would lead the people to demand better qualifications, so that the benefit arising from such a law would be for both teachers and scholars.

XXIII.—TEMPERANCE INSTRUCTION.

Temperance instruction in Minnesota.—Superintendent Kiehle, of Minnesota: The reports from the counties indicate a purpose to honestly execute the law. The subject is doubtless as well taught as others are. The children are easily interested, and I have no doubt will derive much permanent good through the skill and example of good teachers. Nothing should be left undone that will fix in the minds of our youth a sense of the folly and danger of the use of alcoholic beverages and a resolution to entirely abstain from their use.

No measure can better promote temperance and morality.—Superintendent Estabrook, of Michigan: It is certain no measure can be made more effectual for the advancement of the cause of temperance and morality than thorough, faithful, and honest instruction given in our public schools to all pupils in regard to the effects of alcohol and narcotics on the body and soul. * * * I believe in teaching temperance, but not in forcing text-books upon our grades where they can not be used.

Temperance instruction gaining favor.—Superintendent Leech, of Cambria County, Pa.: The subject of physiology and hygiene is growing in the favor of teachers, pupils, and citizens. Our teachers are making rapid progress in the study of the subject. However, in many schools it was but imperfectly taught, and in many of these the law was barely complied with, if at all. The unreasonable prejudice against this new branch in many places is disappearing, but still it exists, and in some cases with the teachers, too. Where it has been properly taught the feeling against this branch, where it existed, is fast disappearing. Can we place too much importance on health of body? What shall it profit us if we gain the whole field of knowledge and lose our own health?

How can any intelligent parent be opposed to this subject when he once knows that its object is to make better men and women, physically and morally, of the boys and girls who shall go out from our schools, and to warn them against the evils of intemperance and instil into their minds a love for temperance in all things. This subject is destined to be one of the most useful as well as one of the most popular studies of our common schools.

XXIV.—TEXT-BOOKS.

Free text-books advantageous.—Superintendent Chapman, of New Jersey: No appropriation of an equal sum can secure greater advantages to the schools than that which is required to furnish the text-books. The district can purchase at a lower price than the individual, and the same book, with proper care, may serve half a dozen pupils in succession instead of one. If the books are so furnished a thorough grading is made possible, and much inconvenience and delay are avoided.

Free text-books authorized in Pennsylvania.—Superintendent Higbee, of Pennsylvania: The grant of authority to school directors to furnish free text-books for their schools is more and more used, and thus far such action has given full satisfaction, not only in our large cities, but in many of our rural districts. It is found to be more economical, saving all loss to parents through change of text-books, and making it possible to commence the work of teaching on the first day of school, each scholar being provided with his books at once, without any annoying delay until parents can purchase. It adds greatly to the enrolment of pupils, for many parents who through poverty or indifference have failed to supply books, and thus have kept their children from attendance, now send them. In Massachusetts the law is compulsory. With us authority only is given, and the directors are to use their own discretion in the matter. The fact, therefore, that the practice of furnishing text-books free steadily gains ground with us is an argument in its favor.

Cost of text-books when furnished free.—H. W. Halliwell, secretary of the board of controllers of public schools of Philadelphia: The cost of books and other supplies for many years has ranged from 80 cents to \$1 per pupil.

Free text-books in New Jersey.—Superintendent Apgar, of New Jersey: Nearly all our cities furnish text-books free of cost to the children. We have fifteen hundred school districts in the State outside the cities, and four hundred of these furnish free text-books. It is my endeavor to get all the districts in the State to adopt the policy which now prevails in so many.

In New York City.—Superintendent Jasper, of New York City: The board of education furnishes all pupils in the public schools with books and school supplies free of expense, and this merits the hearty approval of the citizens of New York City.

In Newark, N. J.—Superintendent Barringer, of Newark, N. J.: We have furnished our pupils with books, slate-pencils, chalk, etc., for many years. It has cost on an average about 45 cents a year for each pupil. We like the plan very much. Its advantages are many. I will name a few of them: Cheapness, convenience, uniformity, complete control of course of study, and removal of all excuses for non-performance of work by pupils.

Text-books furnished free for many years in Jersey City.—City Superintendent Barton, of Jersey City: For many years free text-books have been furnished to the pupils in the public schools of this city. This plan has proven very satisfactory. The cost per pupil has varied from 50 cents to \$1.25 per year for books and stationery.

Free text-books in Woonsocket, R. I.—City Superintendent Thomas, of Woonsocket, R. I.: It is found that the average cost of text-books for the past four years has been 66 cents per pupil. We have never lost a book except by the usual process of wear and tear. I do not know of a single disadvantage connected with the plan. The system works perfectly in every respect, and none of us would give it up.

Want of uniformity prevents good teaching.—Superintendent Cooper, of Texas: In many schools good teaching is a physical impossibility, on account of the variety of text-books which parents desire and trustees allow to be used.

Why school-books should be free.—Superintendent Newell, of Maryland: Why should not the books needed in our common schools be free to the pupils? We have free school-houses, free teachers, free stoves, free fuel, free desks, free black-boards, free wall maps; why not also free school-books? There was a time when none of these things were free, and some were non-existent. The teacher was paid so much a week and "boarded around." The writer has seen, when he was a boy, a band of urchins trooping to the school-house, each with his contribution to the fuel of the day under his arm. He has also in his capacity of teacher had a pupil come to him with his desk carried behind him by a colored man, because "such was the old custom," as his father explained. Now all is free except the school-books, and that tax remains as one of the relics of barbarism.

But why should school-books be free?

(1) Because otherwise the schools are not really *free*. If any money consideration is necessary to the enjoyment of school privileges, the name of "free school" is a mockery.

(2) Because the cost of books keeps some children out of school, and these perhaps the very children who need schooling the most. The parents are too poor to buy books and too proud to be willing to have their children enter as paupers.

(3) Because the book tax introduces invidious class distinctions. Some children pay for their books; others are classed as "indigent" and do not pay. Here is a line of

separation that should not be tolerated in any American school. The pupils should meet in school on the same level, as they will afterwards do at the polls when they come to exercise the right of suffrage.

(4) Because the work of the school can not be carried on promptly and efficiently unless books can be furnished by the teacher on the day they are needed. A teacher wishes to begin a class in grammar. He tells them to bring the proper text-book on the next Monday. Monday comes and only three pupils out of twelve have the book. The opening is postponed till the next day. Next day brings four books and the opening is postponed till next week. Next week sees half the class furnished with books and the teacher debates with himself whether to give up the class or to go on with one-half the members, or to give them another week to procure books. This is no fancy sketch, but a photograph from the life.

(5) Because the want of free text-books enables parents to nullify a law of the State. In most of the States a law has been passed requiring "temperance physiology" to be taught in all public schools, "with the use of text-books as other branches are taught." But a parent by simply refusing or neglecting to purchase the text-book can virtually repeal the law, so far as his child is concerned, and set at naught the will of the majority of his fellow-citizens expressed under constitutional forms.

(6) Because free books are on the whole the cheapest. The State can buy at a much lower rate than a private individual. Nearly one-half of the present money expended on books might be saved by buying at wholesale; and the additional State tax would hardly be felt by the majority of those who patronize the schools.

(7) Because those communities that have tried the experiment of "free books" are perfectly satisfied and could not be induced to return to the old plan.

(8) Because the arguments used against free books are the very same as have been urged and are urged against free schools. "People do not value properly what they have not paid for." If I had a valuable horse given me by a friend should I value him the less because he cost me nothing? Do we think the less of a broad and smooth highway because there is no toll-gate on it?

Lastly, because free books would add ten per cent. to the number of scholars, and twenty-five per cent. to the efficiency of the schools.

Objections to furnishing free text-books to the poor only.—Superintendent Patterson, of New Hampshire: The district furnishes free school-houses, free furniture, free apparatus, and free teachers; why not free text-books as well, and open the schools to the poorest? The patriotic purpose of the public school is universal education, but the object cannot be reached if we throw the expense of text-books upon those who have nothing with which to buy. It is like offering the milk and honey of salvation, which the poor are invited to "buy without money and without price," in marble cathedrals and at golden altars, where only the rich can bow. Experience shows that from ten to twenty per cent. of the school population is excluded by this burden.

But we are told that books are now free to the poor. Yes, and so is the county farm; but they decline your charity, and I am glad of it. I honor the American citizen whose self-respect and parental affection will not allow his child to be stigmatized as a pauper in the knowledge of his companions. The sense of inferiority blights the gems of nobility and dries up the joy of youth at its source. A child should not be punished for its poverty in a democratic system of education. To humiliate scholars at every grade of their progress is a poor way to build up a manly and womanly character, fitted for the responsibilities of a free citizenship. The example is as hurtful, also, to the children of the rich as to those of the poor. It begets in them arrogance, conceit, and an impression of superiority unfavorable to the idea that character is to be measured by intellectual and moral standards, rather than by accidental social distinctions. Compulsory education and free text-books should stand together in a system of school laws.

Free text-books recommended.—City Superintendent Emerson, of Newton, Mass.: The following are some of the advantages of the system of free text-books:

(1) It effects a saving of time. Under the system of individual purchases, a delay of a week, and even more, is not unusual at the opening of the school year. This loss of time involves a large loss of money. Allow me, as a matter of convenience, to illustrate from the schools under my supervision. The city provides instruction for about four thousand pupils. The cost of the schools, exclusive of the interest on the money invested in land and school buildings, is, in round numbers, five hundred dollars a day, reckoning two hundred school days to the year. Viewed from this point, a week's delay becomes a matter of grave importance. With free text-books the work of the schools may begin at once. There need not be a delay of a single hour.

(2) It secures better classification. Not only is the long delay incident to the organizing of the classes prevented, but it enables the teacher to make a better classification of his school. The pupil is examined, his qualifications considered, and then suitable books are given. Formerly parents bought larger books for the older children, and re-

fused to buy smaller books for younger ones. Thus many pupils suffered from want of proper classification. This evil is felt most keenly in country schools. * * *

(3) It effects a saving of expense. First, the cost of the books is less. The pupils pay retail prices or a considerable advance upon wholesale prices; the city or town buys at lowest wholesale prices. On account of the exceptionally large discount allowed on text-books, and other school supplies, the difference between these prices is considerable, sometimes amounting to from twenty-five to fifty per cent. of the retail price. Again, free text-books are used until they are worn out. In the case of individual ownership, they are often thrown aside after being used for a few months or possibly a year.

(4) It cultivates in the pupil the habit of respect for public property. The pupil is required to use the books with care and to return them without spot or defacement. * * *

(5) It secures uniformity of text-books. * * *

(6) It secures to the schools better books and appliances, and a larger variety of them, and thus leads the way to greater flexibility in the work of the school-room. * * *

(7) It increases school attendance and removes caste distinctions. The purchase of books for a large family of children imposes a heavy tax upon the parents. In many instances this tax becomes a greater burden than the parents are willing or able to bear, and the children are taken out of school at an early age or are compelled to wear the badge of pauperism by having their books supplied at the public expense.

Laws for uniformity of text-books condemned.—City Superintendent Bettison, of New Orleans: Is not uniformity an evil rather than a benefit? The teacher who has used only one grammar or one arithmetic is not equal to the one who has used several. Every intelligent teacher knows that it is decidedly to a pupil's advantage to change from one author to another in pursuing the same study. Even when the books are good, change is sometimes beneficial; but when a bad selection has been made, and the teachers throughout a State are indignant because they are compelled to use an inferior or worthless book, how galling is the legal necessity of continuing the wrong for four years.

All educators know that when books are not supported by authority, but are allowed to stand upon their own merits, the unworthy ones are short-lived. An intellectual, conscientious teacher would scorn to recommend a text-book that he regards as inferior; and if an occasional mistake should be made by a local board in the limited introduction of a defective or badly arranged book, it would not be a serious, long-continued, and multitudinous blunder like the legal four-year infliction of an unsuitable or worthless work under the present law. Indeed, it is very difficult for even a good teacher to form a correct estimate of a school-book until he has given it a year's trial in the school-room. How much less the probability of a perfect selection by a body of men who seldom enter a school-room, and who are not, as a rule, chosen with a special reference to their familiarity with the improved modern systems of education. No new book should be introduced without having undergone the closest investigation by a body of trained teachers, who should, if possible, hold meetings for its discussion, and use it experimentally in their classes. * * * The injury is most keenly felt in the cities where there are well-organized systems of schools whose teachers and officers well know their wants.

XXV.—WHAT SHALL BE TAUGHT IN THE PUBLIC SCHOOLS?

Public schools should not attempt too much.—Superintendent Estabrook, of Michigan: In our larger cities industrial schools may be established, where those who cannot be trained at home may have an opportunity afforded for acquiring practice in the use of tools. Technical schools ought to be organized in every State, in which pupils who have finished the disciplinary studies may have the most ample opportunity for acquiring manual skill.

But our schools will fail of accomplishing their object if they are burdened and confused by attempts to teach that which it is not necessary for all to know, or to give training which is not needful to all. The common schools are necessary for the perpetuity and prosperity of the State. The special schools are for the advantage and prosperity of the individual.

Importance of vocal culture and physical training.—Superintendent Williams, of Nashua, N. H.: There is no more important branch of instruction in our public schools than that which tends to the proper development of the vocal organs, and to the correction of bad habits in tone and quality of voice. Good reading cannot be attained, except in rare individual cases, unless considerable attention is given to voice culture from the very lowest grade. At first it may be a mere imitation on the part of the child, as indeed it is, but even in this stage of the child's progress the teacher's correct tone and accent, with distinct enunciation, is a powerful influence for culture. This fact is especially noticeable in schools composed largely of children of foreign parentage, who have heard

nothing but their native tongue at home, and the poorest of broken English among their playmates. Imitation is then the only method which the teacher can use to correct their faults in reading and speaking. She must be to them an example, a copy, a standard, which they are to strive to reach. * * *

Physical training, or gymnastics, as it is commonly called, is of no less importance, if we take into account the fact that the mind cannot act with the best results unless sustained by a healthy body. "A sound mind in a sound body" is a truism that needs to be remembered and heeded with special care during the growing period of the child. If I may be permitted to quote another, "We are blameworthy if, in this age of lavish education, we continue to yoke together active brains and inert bodies, to increase the load upon our shoulders and neglect the means for carrying it." If learning is to be acquired at the sacrifice of health, it would be better not to acquire it. But there is no need of losing health in the pursuit of knowledge. To counteract such a tendency it is necessary that the pupil should maintain correct and regular habits of reasonable recreation out of school, and that physical training be made a part of every-day work in school. Each teacher should set apart a few minutes each day for this purpose, and the other work will not suffer on account of it, but will rather be benefited by it.

The policy of a school not to be determined by a pupil nor his parents.—Superintendent Draper, of New York: The teacher must classify and arrange the school. He must, upon inquiry and examination, determine what studies the pupil should pursue and in what classes he ought to recite. The child must accept the arrangement of the school. He must not only submit to the discipline of the school, but he must pursue the course of instruction outlined for him. The parent can not dictate the policy of the public school towards his own child. I assert the principle broadly and squarely, that when the child is brought to the door of the school-house, and is turned over to the public school system for education, that system is expected to know better what he needs, and better how to do for him what he needs, than the parent who brings him there. * * * He must take such studies, he must observe the rules in such manner, as the public school authorities shall say. Any other rule is antagonistic to the harmony and efficiency of the school system.

* * * * *

The teacher is in no wise subject to the direction or the restraint of the child's parent. Nothing is more common than the interference of parents with the discipline and the course of procedure in the public schools. They become dissatisfied generally, or angry at matters of small importance if they relate to other children, but which are magnified into matters of great moment when they relate to their own. They have no right to expect that they can change the whole policy of the schools so that it shall accord with their personal ideas. There is no sense in beginning a fight upon the teacher because of dissatisfaction with the proceedings of the school. Suggestions should be always welcome. Good ones should be put to good use. But the idea that the parent can control the teacher, even in reference to his own child, must be repudiated. The teacher is not responsible to the parent, but the school system, and the course of the school system is to be determined, not by any one irate individual, but in the usual ways for determining all questions in this country, either through appeal to constituted authority, or by the voting power of a majority of the people. The parent may exercise his influence and his vote to modify the system or change the teacher, but he can not be allowed to manage the school.

If there is any one proposition which I would emphasize, any one thing which I desire everybody connected with the public school system to observe, it is that the power of managing and directing the public schools must be kept with the public school authorities; that it is for them to determine the policy, as it is for them to direct the procedure, of the schools. When they make serious mistakes, their mistakes will be corrected through the proper channels and by the legitimate power of the people, but until they do make mistakes, and until their mistakes are corrected in the proper way, they must be clothed by law with the authority which always goes with responsibility.

Scope of the public schools.—Superintendent Cooper, of Texas: Each public school maintained by the State should give instruction in the subjects which are essential to the formation of good citizenship. For this end, instruction in the elementary branches, if thorough and effective, is sufficient. Other subjects should in general be excluded from ungraded country schools. It would be desirable, if it could be done without too great inconvenience, to authorize trustees of the districts in each justice's precinct to provide for higher instruction in some one school situated near the centre of the precinct, which might be attended by the children within the scholastic age who had passed beyond the subjects which could be advantageously taught in the ungraded country schools. The instruction of two or three pupils in higher algebra, geometry, trigonometry, Latin, Greek, or other subjects than those mentioned before as suitable for ungraded schools requires so much time from the teacher, that these subjects cannot be well taught with-

out detriment to the welfare of the other pupils, who constitute four-fifths of the children taught in the schools. But the educational needs of these few children in each school district, who have passed beyond the elementary subjects and are still within the scholastic age, should be provided for. I am of the opinion that this can not be done effectually without detriment to the interests of the large majority of children in any other way than the one suggested, namely, the organization in each justice's precinct, or any convenient subdivision of the county, of one school which should be authorized to give instruction in all subjects or grades below the high school.

There should be in each county a high school, in which any one within the scholastic age who desired and had the ability to go beyond the course of instruction in primary and grammar schools might fit themselves for active life or for entrance into a university.

The study of civil government recommended.—Superintendent Hoitt, of California: The study of our civil government, including the National Government, and the important points in our State, county, and city governments, should receive more attention in our public schools.

Pupils should be required to memorize the most important portions of the Constitution, and made to understand what they memorize. Such a course will be a very potent method of preparing them for the duties of citizenship.

Music introduced into the schools.—From the Report of the School Committee of Pembroke, N. H.: Music from chart work was introduced into our schools the first of the second term, and we were pleased to note the interest which some of our teachers took in this work and the success which crowned their efforts. If there be any skeptics who do not believe that music can be taught without a professional instructor, they should have visited our village schools at their closing exercises. We know now, if we were in doubt before, that it can be taught with great success and profit. * * * We have introduced music, not to trespass upon the time of the school, but simply as an exercise to be conducted for a few minutes each day, to rest the weary workers and give them renewed zeal and energy for the labors before them.

XXVI.—WORD-METHOD OF TEACHING READING.

The word-method of teaching reading commended.—Superintendent Morss, of Portsmouth, N. H.: More than ten years ago the board of instruction voted that the word-method of teaching reading should be employed. This innovation, as people call it, is not a new idea at all. In 1841 Horace Mann, in a public address, said: "The plan of teaching words first has succeeded wherever it has been fairly tried; and I have no doubt that it will soon wholly supersede the old and doleful method of beginning with the alphabet." Prussia, in 1872, prohibited by law teaching to read by beginning with the alphabet. No effort is made to teach the letters till the child knows how to read, as the names of the letters give no clue to the sound of the combination of letters that makes the word. The reasons for this method are so familiar to all educators that it would be superfluous to state them.

CHAPTER VI.

ALASKA.

Report of the President of the Territorial Board of Education—Letter Transmitting Report of the General Agent of Education—Report of the General Agent—Number and General Condition of the Schools of Alaska: (1) Public Schools; (2) Contract Schools; (3) Indian Bureau Schools; (4) Other Schools—Regulations Prescribed by the Territorial Board: (1) Memorandum of its Organization; (2) Rules for the Government of the Public Schools; (3) Rules for Obligatory Attendance—School Census—The General Agent's Duties—Additional Information: (1) Visit of the Commissioner of Education; (2) How the Rules for Compulsory Attendance Operated; (3) The Exodus to Metlakahla; (4) School-Houses; (5) Boarding and Industrial Schools; (6) Agricultural School; (7) Permanent School Fund.

REPORT OF THE PRESIDENT OF THE TERRITORIAL BOARD OF EDUCATION.

TERRITORIAL BOARD OF EDUCATION,

Sitka, Alaska, February 6, 1889.

SIR: On September 15, 1888, Dr. Sheldon Jackson, general agent for Alaska, made a report in writing concerning the public schools in the district, and laid the same before the board as then constituted, the members present being the Acting Governor, Dr. Jackson, and myself. I had only been in the district a few days, and was compelled to accept the statements of the report *pro forma*. Under those circumstances the report was approved and forwarded to your office. Subsequently, after the return of Governor Swineford, and at a meeting of the newly constituted board, consisting of five members, upon the motion of Governor Swineford, based upon a number of material inaccuracies in the report, it was recalled.

The only meeting of the board after the receipt of the report was on the 25th of January, when it declined to enter into the subject further than to instruct me to draw up a report of the public schools in the district for the year ending June 30, 1888.

Dr. Jackson is not in the district to aid me in that duty. I was not a member of the board during any part of that fiscal year. By reason of the absence of Dr. Jackson, I have not access to any of the official records of the board for that period to aid me.

I beg leave to make the following imperfect report:

SCHOOLS OPEN.

Unga.....	1	Metlakahla.....	1
Afognak.....	1	Sitka.....	2
Kodiak.....	1	Ind. Bu., Sitka.....	1
Douglass City.....	1	Bethel.....	1
Fort Wrangell.....	1	Carmel.....	1
Haines.....	1	Hoonah.....	1
Howkan.....	1		
Juneau.....	2	Total.....	18
Killsnoo.....	1		
Klawack.....	1	Pupils enrolled.....	1,435

In addition to the foregoing public schools for whites and natives there is at Sitka an Indian school, under the auspices of the Greco-Russian Church, maintained by the Holy Synod in Russia, which employs two teachers, and has an enrolment of fifty. English is taught in this school, and in the visits I made thereto I found it one of the most flourishing ones in the district.

The Sisters of Charity also maintain a hospital and a school at Juneau. They are struggling against poverty and isolation, but are doing good in an unostentatious way. They have, however, the cordial co-operation of the hardy mining population at Juneau.

Rev. Adolf Lydell also established, under the auspices of the Free Mission Society of Sweden, a mission school near Tukulat, and erected a log school-house.

The Indian industrial school at Sitka, included in the total of eighteen schools heretofore summarized, had an enrolment of one hundred and eighty-six pupils. The average number of instructors, including nurse at the hospital attached thereto, was twelve.

There were very few facilities, and are yet few, for industrial instruction, as distinguished from general education, for the boys at this school. They have a blacksmith-shop with one set of tools. There is no demand here for any such work to give employment for boys while undergoing industrial instruction. The carpenter-shop is also small and only a few boys can be instructed in and about it. The printing-office is only a moderate affair, and not equal to the capacity of training more than three or four in that art. The shoe-shop is of the same modest proportions. The fact is that, as the institution is now constituted in facilities and means of industrial education, there is practically no labor for the boys beyond the simplest kind of manual labor, such as sawing wood for the consumption of the school and the buildings attached.

The principal, Mr. Kelley, and the teachers and instructors have been doing all that can possibly be done with the means of industrial education which they have had within reach. I am clearly of the opinion that before the industrial features of this school can be realized that that department must be reorganized by a careful selection of such occupations as will be useful to this peculiar people when they leave the school to go out into the world to earn a living for themselves; and also when the occupations are selected in which to train them that the facilities of competent and efficient training be amply provided. This is not the case now as to the boys, but it is not the fault of those in management. It has been, so far, the want of money. There is not even a fish-cannery here where they might be put to training. The means of giving the girls some kind of an education that will fit them for wives and mothers are more ample, and are far more useful than anything in an industrial way that has been provided for the boys. Looking at the experience and results at Metlakatla I am satisfied that the most practical thing to be done is the erection of a small steam saw-mill and a planing-mill of moderate capacity for the making of packing-cases for fish-canneries. This is an industry natural to the country and demanded by one of the two other great industries of this district. In view of the fact that the Government is now dealing liberally by the way of appropriations to this school, I suggest that a plan of industrial reorganization be carefully matured, one that is really adapted to the circumstances and natural surroundings of the natives.

I attach hereto an abstract of the monthly enrolment, marked A, and one of classification of studies, marked B.

My rapidly increasing judicial duties since I arrived in Alaska, and duties of that character since the order of the board mentioned in the first part hereof, have prevented me from making any other in accordance therewith than this now submitted.

I hope to supplement it in some suggestions hereafter in regard to the means of increasing the efficiency of the industrial school here.

Yours, very respectfully,

JNO. H. KEATLEY,
President.

Hon. N. H. R. DAWSON,
Commissioner of Education, Washington, D. C.

LETTER TRANSMITTING THE REPORT OF THE GENERAL AGENT OF EDUCATION.

TERRITORIAL BOARD OF EDUCATION,
Sitka, Alaska, September 15, 1888.

SIR: The Territorial board of education in Alaska has the honor of transmitting to you the annual report for 1887-88 of the general agent of education in Alaska, with its approval of the recommendations contained except as follows, to wit, the recommendations for school-houses at Kodiak and Afognak, and for industrial boarding schools at Kodiak and Unalaska. As it is expected the Governor, who is now visiting Western Alaska, will have more definite information on those items, they were withheld for future action at the request of the general agent himself.

The following recommendations of the report were taken up seriatim, discussed, and adopted unanimously:

(1) The Commissioner of Education is recommended to allow the Episcopal Board of Missions for the school at Anvik, and the Moravian Board of Missions for the schools at Bethel and Carmel, compensation for 1887-88, proportioned to the time taught and the number of pupils.

(2) That school-houses be erected at Douglass City and Metlakatla.

(3) That the Board offer to co-operate with the Commissioner of Agriculture in an effort to establish an experimental farm in connection with the Sitka Industrial School.

(4) That the Commissioner of Education allow from the school fund eight dollars per month towards the wages of native policemen to enforce the regular attendance of children at school.

(5) That legislation be asked from Congress to secure a permanent school fund for Alaska.

(6) That local school committees be appointed wherever practicable.

(7) That the yard of the Sitka School No. 1 be graded and seeded down to grass, and that gutters be placed around the eaves of the school-house.

Present at the meeting, Acting Governor H. E. Haydon, Judge Keatley, and Dr. Jackson.

By order of the Board.

JNO. H. KEATLEY,
President.
SHELDON JACKSON,
Secretary.

Hon. N. H. R. DAWSON,
U. S. Commissioner of Education.

REPORT OF THE GENERAL AGENT TO THE TERRITORIAL BOARD.

SITKA, ALASKA, June 30, 1888.

To the TERRITORIAL BOARD OF EDUCATION, *Sitka, Alaska*:

GENTLEMEN: In compliance with the regulations governing the public schools and school officers of Alaska I beg to submit the following as the annual report of the general agent of education:

A.—NUMBER AND GENERAL CONDITION OF THE SCHOOLS IN ALASKA.

Alaska has fifteen schools (with 1,261 pupils), supported in whole or in part by the Government; fifteen parochial schools of the Russian Church, with 300 pupils, one being in Sitka; one Presbyterian mission school, at Hoonah, with 136 pupils; two Moravian schools, at Bethel and Carmel, with 33 pupils; one Roman Catholic school, at Juneau; one Episcopal school, at Anvik; two Swedish mission schools, at Unalaklik and Yakutat, and the two schools of the Alaska Commercial Company, with 82 pupils; making a total of thirty-nine schools and over 1,800 pupils.

I. PUBLIC SCHOOLS.

1. *Unalaska District.*

Unga (Public).—Prof. John H. Carr, teacher; enrolment 25. Owing to sickness in his family Mr. Carr closed the school the 1st of April and returned to the States. Prof. John A. Tuck, of Long Island, New York, was appointed in his place.

The citizens of Unga are the banner people of Alaska in their interest in the education of their children. During October, 1887, they erected and paid for a neat and substantial school-house 20 by 24 feet in size. This is the first community in Alaska to erect their own school building. Their public spirit deserves honorable mention.

2. *Kodiak District.*

To the eastward of the Unalaska District comes that of Kodiak with its two schools of Kodiak and Afognak.

Kodiak (public).—Prof. W. E. Roscoe, teacher; enrolment 81. In addition to the public school for the children Professor and Mrs. Roscoe hold an evening school for adults who desire to learn English.

Mr. Roscoe reports that the pupils have made much greater progress this year than last. This has particularly been the case in geography, temperance hygiene, and the use of the English language. To this latter special prominence is given, regular talking exercises being had each day. The use of the Russian language in the school is prohibited. Kodiak is one of the leading centers of the Territory and ought to have a good school building.

Afognak (public).—Rev. James A. Wirth, teacher; enrolment 24. Professor Wirth reports that the two great hinderances he meets in his work are the want of appreciation on

the part of the parents as to the value of an education, and the impossibility of crowding more than twenty-four pupils into the small, inconvenient, and uncomfortable room that he is compelled to use for the school. Some of the children are making good progress in reading, writing, drawing, and singing. In arithmetic they seem very slow, but in any study not requiring abstract thought make rapid progress. This place greatly needs a comfortable school-house situated midway between the creole and native settlements.

For reasons mentioned hereafter I have been unable to visit any of these schools for two years past.

3. Sitka District.

We come now to the Sitka district, with its sixteen schools, including a Swedish mission at Yakutat, a Roman Catholic school at Juneau, and a Russian Church school at Sitka.

Douglas City (public).—This school was commenced under the auspices of the Society of Friends by Messrs. E. W. Weesner and W. H. Baugham, in the summer of 1887. In February, 1888, Mr. Baugham returned to the States and his place was supplied by Mr. and Mrs. S. R. Moon. Mrs. Moon was in charge of the school after her arrival. Enrolment, 67.

Concerning the pupils Mrs. Moon, who had been a teacher for years among the Indians of Kansas and the Indian Territory, writes: "I have never worked among a more intelligent people of a heathen character than the natives of Alaska. The girls are needing our special care. They are intelligent; have fine features. If we would take these girls at five years of age and train them properly they would make the best of house-keepers.

Douglas City being in the immediate vicinity of the most extensive gold mining interests in Alaska should have a suitable school building.

Fort Wrangell (public).—Miss Lyda L. McAvoy, teacher. Enrolment, 106. This is the oldest and most advanced day school in the Territory.

During the past year, through the energy of Hon. James Sheakley, United States commissioner, and with the approval of the honorable Commissioner of Education, the old building occupied by the school has been overhauled, repaired, repainted, and fitted up in a comfortable manner.

Haines (public).—Dr. F. F. White, teacher. Enrolment, 140. This school is one hundred miles from a post-office or civil officials. There being no way provided for enforcing regular attendance, the average was low for so many children.

Those that did attend manifested much interest. The teacher reports that he never knew children prouder or better satisfied than when pupils who had previously known nothing of English could sing a few verses or read a lesson nicely from their first reader; that just as soon as they were able to distinguish one letter from another on chart or book, the puzzled look gave way to smiles of delight, and from thenceforward rapid strides were made in first, second, and third readers.

✶ The school was somewhat interfered with during the winter by witchcraft persecutions.

In the spring, when the people left their homes to pack supplies for the Yukon miners over the wild and dangerous mountain passes that guard the interior from the coast, taking their families with them, Dr. White and his wife, with great self-denial, followed the people to their temporary home at Tyra inlet and continued school until the 5th of June, when, an outbreak occurring by which a leading chief lost his life, the excitement was so great that it was thought best to close the school for the summer vacation.

Howkan (public).—Miss Clara A. Gould, teacher. Enrolment, 110. This is one of the successful schools of the country and deserves the new school building which it is to have the present summer.

Juneau (public) School No. 1 (whites and creoles).—George B. Johnston, teacher, reports a total enrolment of only 25 in the largest American settlement in the Territory. The conduct of the school was the least satisfactory of any under my jurisdiction.

Juneau (public) School No. 2 (natives).—Miss Henrietta Jensen, teacher. Enrolment, 67. The only pupils in this school that were regular in their attendance were those from the Presbyterian Mission Home, in charge of Rev. E. S. Willard.

Miss Jensen reports concerning them: "Many of the scholars, who, when the term began last September, could not speak a word of English, can now not only speak but read and write it. They can also spell correctly, and are beginning in the first principles of arithmetic. To the casual observer perhaps nothing seems more absurd than to attempt by any process to enlighten the clouded intellect of these benighted people. Indeed, the most squalid street Arabs might be considered a thousand times more desirable as pupils.

"But a few days' work among and for them convinces the teacher that she has not a boisterous, uncontrollable lot of children, but as much the opposite as it is possible to imagine. Children who habitually refrain from playing during intermission that they

may learn some lesson or how to do some fancy work are not to be classed with the wild, wayward, or vicious. Boys who, when their regular lessons are done, are continually designing and drawing cannot be said to be entirely devoid of talent worthy of cultivation. While the development must be slow in most cases, there are a few that could compare favorably with white children of the same age. Their abnormal development of the faculty of form gives them an inestimable advantage over their more favored pale-face brothers in acquiring the art of writing and drawing. Their minds act very slowly, but they make up in tenacity of purpose what they lack in aptness."

During this present season a pleasant and commodious school building has been erected for the use of both schools.

Killisnoo (public).—Miss May Ransom, teacher. Enrolment, 44. The teacher reports a successful year. The comfort of the school has been greatly increased by the possession of a suitable school building, which was the first one in Alaska erected by the Government.

Klawack (public).—Prof. L. W. Currie, teacher. Enrolment, 81. The school has labored under the disadvantage of an uncomfortable building; also distance from any protection of law.

Drunkenness and witchcraft have kept the community in a constant turmoil. During the winter four native men (Hauegahs) forced their way into the house of the teacher, and charging a native girl, whom he was sheltering in his family, with being a witch, attempted to carry her off by force in order to torture her. Mr. Currie, at the risk of his life, drove them off and saved the girl. Two months later the same men, re-enforced by a large party of the worst element of the Hydah, made another attempt to secure the girl. They sang their war song and brandished their knives, but were foiled in securing the girl. Failing in that they so far intimidated her brother as to compel him to pay a ransom in blankets, the currency of the people.

Notwithstanding these drawbacks the school made good progress.

Metlakahla (public).—Mr. William Duncan, teacher. Enrolment, 170, with an average attendance during January, 1888, of 159.

For years the most successful native mission on the Pacific Coast has been at Metlakahla, British Columbia, under the leadership of Mr. William Duncan. It was an object lesson studied by the natives far and near, and an example that many desired to copy.

Sitka (Public) School No. 1 (whites and creoles).—Miss Margaret Powell, teacher. Enrolment, 60. During the year a substantial and pleasant school-house has been erected, and as a result the teacher reports that the progress of the children has doubled.

Sitka (Public) School No. 2 (native).—Miss Virginia Pakle, teacher. Enrolment, 71. This school, like so many others, has labored under the great disadvantage of an unsuitable and uncomfortable building. For want of better it occupied an old, rotten, condemned log building, formerly used as a native market place. As the honorable Commissioner of Education has authorized the erection of a new building, another year will see the school in better shape. With regard to progress the teacher reports it satisfactory.

II.—CONTRACT SCHOOLS.

Owing to the difficulty of conducting schools on the coast of Behring Sea, where there is mail communication but once or twice a year, a small compensation was allowed to the schools on the Kuskokwim and Nushagak Rivers, established and conducted by the Moravians.

Bethel, Kuskokwim River (public).—Mr. John H. Killbuck, teacher. Enrolment, 17. In the spring of 1887 the Rev. W. H. Weinland, who had been in charge of the school, resigned on account of health and returned to the States. His place was taken by Mr. J. H. Killbuck, who had accompanied Mr. Weinland to Alaska in 1885, and has made some progress in learning the language of the Eskimo, among whom he lives.

Owing to sickness in his family school was open only eight months out of the ten. The largest attendance any one month was seventeen, in March. In February the monthly enrolment and average attendance were both sixteen.

The small attendance of the year is partly due to the opposition of the priest of the Greco-Russian Church, and more largely to the prejudices and superstitions of the people themselves. As soon as a boy is old enough to go to school he is of value to his parents in hunting and fishing, and they are loath to let him go. It is still more difficult to secure the attendance of the girls.

A daughter is the main-stay of the family. At the age of ten or twelve years she is sold to a man for his wife. He then takes up his abode with and works for his parents-in-law. If he finds his fortunes too severe, or tires of his wife, he simply goes off, and in a short time his place is occupied by some one else, who has been persuaded to marry the grass-widow.

Nearly all the children attending the school to the present time have been orphans, who come of their own accord. There is no doubt but that the attendance will greatly increase in the course of a few years, as it takes time among an uncivilized people to enable them to comprehend in some measure the advantages of an education for their children.

During the present summer the school-house has been enlarged and rendered more commodious, and the Rev. Ernest Weber, of Iowa, sent out to assist Mr. Killbuck.

Carmel, Nushagak River (public).—Miss Mary Huber, teacher. Enrolment, 21.

In the summer of 1887 Rev. F. E. Wolff, wife and two children, and Miss Mary Huber arrived at the Nushagak River to open a school and mission. When the call came for a teacher for the Eskimo on the Nushagak Miss Huber was the accomplished and successful principal of a young ladies' seminary in Pennsylvania. Resigning her important position and leaving all her congenial surroundings she gladly gave herself to teaching the low-down Eskimo.

Being three thousand miles from supplies and trained workmen the erection of the necessary buildings consumed the whole season and it was the first of January, 1888, before they were in shape to open school. But that was the time of the holiday festivities of the Russian Church and the whole native population went off to Nushagak Village, three miles distant, to attend them and remained a week.

The Russian celebration was followed by the annual dance of the natives at a village forty miles away and again the whole settlement was away.

It was January 17 before school was able to commence. It opened with nine pupils, which increased to twenty-one. The progress of the school seemed to have awakened the jealousy of the Russian priest, who soon forbade the people allowing their children to attend school, telling them that it was bad. Attempts were also made to frighten the children, telling them that if they learned English the Government would carry them off to San Francisco and make soldiers of them. The persecution of the children that attended school was so great that whenever the priest or his deacon was seen passing the school-house some of the children would duck their heads below the window-sill and others would try to hide.

To encourage the children in their attendance the school furnished them two substantial meals a day. Those that were regular in their attendance made very gratifying progress in their studies.

The difficulty of securing regular and adequate attendance among the uncivilized tribes is so great that the conviction grows from year to year that the true policy of the Government is to encourage among them the establishment of home schools into which can be gathered orphans, waifs, and those that would come from distant villages if they were assured of shelter and food.

The population along all the large rivers in the interior of Alaska is distributed among a large number of small villages.

It is impracticable to place a school in each or even in every fifth or tenth one. The only practicable way at present of reaching the children is to have in the valley of each large river a centrally located school with accommodations to board those that come from a distance. Plans are being consummated at Carmel to board such pupils. At the mouth of the Nushagak, the present season, are four salmon canneries employing two hundred white men and four hundred Chinamen with from six to eight vessels.

These industries gather in a large number of natives and make Carmel an important centre for a school.

III.—INDIAN BUREAU SCHOOLS.

Native Industrial Training School, Sitka, Alaska.—Prof. William A. Kelly, principal. Enrolment, one hundred and eighty-six boarding pupils.

This school hitherto has been one of the contract schools of the Indian Bureau; but, as with the approval of the honorable Secretary of the Interior, the Commissioner of Education, and the Commissioner of Indian Affairs it is hereafter to come under the supervision of the Education Office, it is proper to refer to it here.

This school was established by the Presbyterian Board of Home Missions in 1880 as a day school, with Miss Olinda A. Austin as teacher. The following fall, circumstances led to opening of a boarding department. The institution has grown until there are connected with it two large buildings, one for boys and the other for girls; an industrial building sheltering the carpenter-shop, boot and shoe shop, printing-office, wood-carving department, brass band, and boat-house; a steam laundry; a bakery; a blacksmith-shop; a hospital; and six model homes; and nineteen teachers.

The one hundred and eighty-six pupils represent fifteen nationalities or tribes. Being the only institution in Alaska with a large plant, the circumstances of the country are making it a many-sided school.

It is practically an orphan asylum. In the absence of any public provision by the Government for the care of needy orphans, they are freely received into this home.

It is a *nursery*. Small children whose mothers have died, and there is no one to care for them, are also received.

It is a *refuge* for homeless and friendless waifs; for children fleeing for their lives from the tortures of witchcraft. They here find a good home and training that will make them good citizens instead of allowing them to grow up vagabonds.

It is a *reformatory* to which the United States district court, not knowing what else to do with young offenders, has committed them. This department will be enlarged when suitable buildings can be secured.

It is a *trade school*, being the only place in Alaska where a young man can learn a trade.

It is a *high school* to which bright pupils in the various day schools desiring greater advantages than their local school can afford them may be advanced.

It is a *normal school*. If in the immediate future Alaska is to have any native teachers they are to-day among the young men and young women in the Sitka Training School.

IV.—OTHER SCHOOLS.

1.—Unalaska district.

The school at Anvik that was in commission last year was not this. But being about three thousand miles from a post-office, with only a chance mail once a year, the teacher supposed that he was still in the employ of the Government, and has sent in his annual report.

Anvik, Yukon River (Protestant Episcopal).—Rev. Octavius Parker and Rev. John W. Chapman, teachers. As mentioned in a former report, in the summer of 1886 Rev. Mr. Parker and family reached St. Michael and attempted to open a school at that point, but did not succeed. In the summer of 1887, with the full approval of the general agent of education, he removed the school from St. Michael, on the coast, to Anvik, a native village in the Lower Yukon Valley.* This was in accordance with the original plan to establish a school in the valley of the Yukon.

In the spring of 1887 Mr. Parker was joined by Rev. John W. Chapman. At Anvik they purchased and fitted up buildings for school and residence purposes, and arranged the work between them as follows: Mr. Parker was to teach three hours each day and get supper; Mr. Chapman two hours a day and get the breakfast and dinner. On Saturdays Mr. Parker did the baking, and Mr. Chapman the washing and ironing.

The statistics of daily attendance has not yet reached this office.

Seal Islands (Saint Paul and Saint George).—These two schools are maintained at the expense of the Alaska Commercial Company, in accordance with their contract with the Government. The reports are supposed to be sent to the Treasury Department. I notice that Mr. George R. Tingle, special agent of the Treasury Department, in his annual report, July 31, 1887, makes no mention of the schools. It is presumable, however, that with the fixed population of those islands the school attendance varies but little from year to year. In 1884 Saint Paul reports an enrolment of fifty-four, and in 1881 Saint George twenty-eight. These are the latest figures to which I have access.

Unalaklik, Norton Sound (Swedish mission).—Rev. Axel E. Karlson, teacher.

In 1887 the Free Mission Society of Sweden was so deeply impressed with the neglect and degradation of the natives of Alaska that it sent two teachers to this Territory, Mr. Karlson locating at Unalaklik, sixty miles north of Saint Michael on Behring Sea, and Rev. Adolf Lydell at Yakutat.

Mr. Karlson reports that it was with great difficulty that he was able to secure the materials and erect a small school-house. In September, 1887, he opened his school with Eskimo children. They made good progress during the winter.

One boy, who had already learned the Russian language, made such progress through the winter that in the spring he was able to converse in English. Others mastered the alphabet and were able to read intelligently in simple sentences. Special attention is given to the English language. Mr. Karlson has gone to San Francisco for material for a larger and better building.

2. Sitka district.

Respecting the Roman Catholic school at Juneau I have been unable to obtain any report.

Hoonah (Presbyterian).—John W. McFarland, teacher. Enrolment, one hundred and thirty-six. This school, sixty miles from a post-office, is the most inaccessible of all the schools of the Alexander Archipelago. Owing to the fact that the whole population leave their homes in the spring to hunt sea otter or work in the mines, and do not return until fall, the school was open only during the five winter months. This school received no Government assistance last year. It would be well to place it on the same footing as the day school at Metlakahla and allow a certain amount per pupil per quarter.

*But without notice to the Commissioner of Education.

Yakutat (Swedish mission).—Adolf Lydell, teacher. During the present season Rev. Adolf Lydell, of the Free Mission Society of Sweden, has built a log house on the main land east of Khantaak and opened an English school.

Schools of the Russian Church.

In addition to the above schools the annual report of the Governor for 1887 mentions fifteen parochial schools under the care of the Russian Church, reporting three hundred pupils, of which one, in Sitka, has been mentioned.

B.—REGULATIONS PRESCRIBED BY THE TERRITORIAL BOARD.

I. MEMORANDUM OF ITS ORGANIZATION.

On the 14th of July, 1887, the Hon. A. P. Swineford, Governor, Hon. La Fayette Dawson, judge of the United States district court, and Dr. Sheldon Jackson, United States general agent of education in Alaska, having been on June 15, 1887, appointed by Hon. L. Q. C. Lamar, Secretary of the Interior, as a Territorial board of education, met and organized at the office of Judge Dawson at 3 o'clock p. m.

Judge Dawson was elected chairman. At a subsequent meeting the board adopted the following rules and regulations, which were drawn up by Judge Dawson at the request of the board:

II. RULES FOR THE GOVERNMENT OF THE PUBLIC SCHOOLS OF ALASKA.

I. The school-bell shall be rung promptly at 9 o'clock a. m. and at 1 o'clock p. m., and all pupils must be promptly in their seats thereafter.

II. The teachers shall have complete control of their respective schools when in session, and may suspend an unruly pupil until the case can be heard and passed upon by the educational board.

III. Corporal punishment should not be inflicted except in extreme cases of misconduct, and then in moderation only.

IV. Calling of names, the use of slang phrases and vulgar language, must be prohibited by the teachers, and if persisted in by the pupil or pupils who indulge in the use of such terms, names, or vulgarity, so as to shock decency, must be reported to the educational board.

V. All absentees and their parents must be reported to the board, where proper action can be taken in relation to their dereliction of duty under the compulsory rule adopted by this board.

VI. The teachers must labor during school hours to advance the pupils in their studies, to create in their minds a desire for knowledge, principle, morality, politeness, cleanliness, and the preservation of physical health.

VII. Six hours shall constitute a school-day, beginning at 9 o'clock a. m. and ending at 4 p. m.; with one hour's intermission from 12 m. to 1 p. m., and recess hours must be regulated by the teachers and at such time and for such length of time as their judgment may approve, but promptness to return at the ringing of the bell must be inculcated and enforced.

VIII. And as the teachers of the various schools in Alaska are, as regards their pupils, *in loco parentis*, the custody, care, and moral training of their pupils are in a measure submitted to their judgment and discretion, but with the understanding that all questions which in magnitude exceed the power herein conferred upon the teacher must be reported to the board of education.

Obligatory Attendance.

At the opening of the year Judge Dawson, at the request of the board, drew up the following rules to secure a more regular attendance of pupils at school. They were submitted to the United States Commissioner of Education, and meeting his approval, were adopted by the board.

III. RULES FOR OBLIGATORY ATTENDANCE AT ALASKAN SCHOOLS, APPROVED BY THE COMMISSIONER OF EDUCATION, AUGUST, 1887.

In pursuance of the regulations prescribed by the Secretary of the Interior, under an act of Congress approved May 17, 1884, in relation to public schools in Alaska, and under authority of Rule B in the regulations so prescribed by the Secretary in conferring authority upon the board of education by him appointed "to provide general rules for the government of the schools and the attendance of the children," this educational board has prescribed and adopted the following as to the attendance of children of school age:

Every parent, guardian, or other person having control or charge of any child or children of the age of six years and under the age of fourteen years, residing within two miles of any school established and maintained by the Government in Alaska, shall send such child or children to such school at least two-thirds of the time during which such

school shall be taught each school year, unless it can be satisfactorily shown that such child or children is or are physically or mentally disabled. To the end that such regulations may be enforced the deputy United States marshals and Indian policemen, appointed upon the recommendation of the Governor by the Commissioner of Indian Affairs at Washington, are hereby authorized and empowered, and it is hereby made their duty, to see that all children of school age herein designated and within the limits and distance herein set forth attend said schools: *Provided further*, That when it is made to appear that the presence and services of any child of school age as herein prescribed are necessary to the care, protection, and comfort of such parent or guardian in case of sickness, accident, or any physical or mental infirmity, it shall be a good excuse for such non-attendance.

C.—SCHOOL CENSUS—PUBLIC AND PRIVATE SCHOOL.

ATTENDANCE—NON-ATTENDANCE.

It has not been practicable to take any census of schoolable youth in this Territory during the year under review.

It follows as a necessary consequence that the volume of non-attendance upon schools is equally a matter of conjecture or estimate.

The following table shows, for public, Indian, and other schools, from which reports have been received, the *enrolment* of pupils and the *monthly attendance* of pupils.

Parker, Rev. Octavius, at Anvik.	Wolf, Mrs. F. E., at Carmel.

E.—RESPECTING THE GENERAL AGENT'S DUTIES.

SUPERVISION.

I have not been able to comply with the rule requiring the general agent to visit every school in the Territory at least once a year. There is no regular means of communication with the schools in the Unalaska and Kodiak districts. During the summer the United States steamship *Thetis* made a tour of the villages of those districts, and it was understood that she was to enable the Government officers to discharge their respective duties. But when she arrived at Sitka no officer was allowed transportation but the Governor. Even in the Sitka district it was impossible to visit the schools at Howkan and Klawak for want of transportation.

It would add to the general efficiency if at each place where there is a suitable white population a local committee of three be appointed by the Commissioner, upon the nomination of the board, whose duties should be to provide fuel, look after repairs to the school-house, direct the school policeman, visit the school, and recommend to the Territorial board such things as may seem to be important for the welfare of the schools in their place. In several places suitable persons can be found who will perform such service gratuitously because of their general interest in education.

F.—ADDITIONAL INFORMATION.

Many particulars which, strictly classified, should appear under this head have been mentioned under topic A. I now give some information which I hope will explain some of the difficulties in the way of managing and teaching the schools in this outpost of Federal territory, without civil or military organization, and practically without any civilized organization of society, industry, or belief.

To some of these topics recommendations are attached; these are made with a view to increasing the efficiency of schools in the future.

VISIT OF THE COMMISSIONER OF EDUCATION.

The beginning of the school year now under review was marked by the visit paid to the schools of the Territory by the Hon. N. H. R. Dawson, United States Commissioner of Education, who spent part of the months of July and August, 1887, in consultation with your honorable board, and in examining many matters of importance, wherein his discriminating judgment was of great value both to the board in the performance of its duties, and to the schools under its supervision.

It would be proper here to make a more particular mention of Colonel Dawson's visit, if it had not formed an important part of earlier communications from me and from your board to the authorities in Washington.

HOW THE REGULATIONS FOR COMPULSORY ATTENDANCE OPERATED.

At Fort Wrangell, where these rules were enforced through the vigilance of Hon. James Sheakley, United States commissioner, and William G. Thomas, deputy marshal, the best of results followed. At Juneau, partly through a misapprehension of the requirements of the law, no real effort was made to enforce it. At Sitka the hands of the board were tied for the want of a policeman under their control. At the other schools for the want of proper civil officials to enforce the law nothing was attempted. If it is necessary for the Government to provide schools (of which no intelligent citizen has a doubt), it is equally necessary for the Government to compel the people to avail themselves of the advantages offered.

This is particularly true among the half-civilized people for whom the majority of the Alaskan schools are established.

Neither parents nor children have any appreciation of the importance of regular attendance at school. Nor is it to be expected that they should have. If the head of the family goes a-fishing the mother and children accompany him, and the children are out of school a week or two. If at home, the children are often kept to carry wood or water. Then again, parents neither compel nor encourage attendance. It is left entirely to the passing whim of the child.

To secure the best possible results from the school system it is absolutely necessary that the Government should use some pressure. Learning wisdom from the failures of the past, the board have unanimously recommended to the honorable Commissioner of Education that at each of the places where schools are established the sum of eight dollars per month be allowed from the school fund towards paying native policemen to enforce the attendance law.

The United States Indian Office has allowed nine dollars per month for the services of such men in keeping the peace. The union of the two sums, making the modest wages of seventeen dollars per month, will secure the services of good men who will act both in the interest of the school officers and of the Territorial school board. This recommendation is renewed among others at the close of this report.

THE EXODUS TO METLAKAHTLA.

We have the strange spectacle for the nineteenth century of eight hundred people, brought from barbarism and cannibalism to Christian civilization, giving up their comfortable homes and improvements, sacrificing their property, and going out into the untrodden wilderness to make new homes, and all for conscience' sake. They moved across the international boundary line into Alaska, and transferred their allegiance from Canada to the United States. They have settled at Port Chester, Annette Island, and named it Metlakahtla, United States. During the past year they have felled the heavy forest trees upon their new village site, erected over one hundred temporary frame and log habitations, one substantial guest house, two large buildings for public purposes, and set a good saw-mill in operation. The Hon. N. H. R. Dawson, Commissioner of Education, who was present at the landing and taking possession of the new site, and who gave the people warm words of welcome, was so interested in them that he was able to assist them in starting a day school. This largest day school in Alaska is taught by Mr. Duncan and four native assistants. In this commencement of their new enterprise it would be a great encouragement if the Government would erect a suitable school building.

SCHOOL-HOUSES.

One teacher, from her own bitter experience, reports: "Better have no school than keep it in an unsuitable room." While not endorsing her view, it is still true that suitable and comfortable rooms have much to do with the efficiency of the school.

During the year past new school-houses have been provided for the schools at Unga, Sitka, Killisnoo, and Juneau, and the house at Wrangell refitted and made comfortable.

School-houses are urgently needed at Kodiak, Afognak, Douglass City, and Metlakatla.

BOARDING AND INDUSTRIAL SCHOOLS.

The annual reports of the teachers more and more emphasize the fact that among the native population the best results can be had only where the children are separated from their home surroundings.

To do this necessitates a system of boarding schools. As there is already one at Sitka that supplies south-eastern Alaska, I would advise one at Kodiak for the Kodiak district and one at Unalaska for the Unalaska district.

AGRICULTURAL SCHOOL.

The United States Commissioner of Agriculture, in his last Annual Report, having suggested that a station be established in connection with the Sitka Industrial School for "conducting a series of careful experiments to ascertain the agricultural products best adapted to the climate and soil of Alaska, and what breeds of cattle and other domestic animals are most suited to its climate and soil," I would recommend that the board offer to co-operate with the honorable Commissioner in carrying out some such arrangement.

As early as 1885 I made application to the Commissioner of Agriculture for an experimental farm in connection with the Sitka school; and in my annual report on that school for 1885 wrote: "There is a wide diversity of views concerning the agricultural and horticultural capabilities of this region, and necessarily great ignorance. The early Russian settlers were here for furs, and the more recent Americans for mining and trading. No systematic effort, intelligently prosecuted, has been made to ascertain what can or cannot be raised to advantage. The industrial training school of this distant and but little known section of the United States furnishes a basis for a department that shall make careful experiments extending over a term of years to ascertain the vegetables, grains, grasses, berries, and small fruits, apples and the larger fruits, trees, flowers, etc., best adapted to the country; the best methods of cultivating, gathering, and curing the same; tree planting and grafting of fruit trees; the development of the wild cranberry; cattle, hog, and poultry raising, and butter and cheese making. If the Government will determine what can be done in this direction both settlers and natives will utilize the information gained. Such a course will add both to the wealth of the country and the comfort of the people."

PERMANENT SCHOOL FUND.

The present method of supporting the schools of Alaska by an annual appropriation from Congress is very unsatisfactory. As Congress one year voted \$25,000, and the second nothing, and the third \$15,000, it can readily be seen that neither the school board nor the teachers can arrange for the schools until after Congressional action has been taken, nor until such action can they be sure that there will be any schools. And not only that, but some years the action of Congress is not known in Alaska until three months after the fiscal school year commences. A failure on the part of Congress any one year to make the necessary appropriation would close the schools, scatter Government property, and throw the teachers out of employment thousands of miles away from home and friends.

The disadvantages of the present system need but to be stated to be seen.

To remedy this I would renew my recommendation of last year that Congress be asked to set apart one-fourth of the gross revenues of Alaska annually as a permanent fund for the education of the children of Alaska, without distinction of race.

In the Western States and Territories the general land laws of the country provide that sections 16 and 36 in each township are set apart for the use of the schools in said States and Territories. In some of the States this has been a munificent endowment.

But Alaska has no townships and no surveyed lands, and no law by which they can be surveyed. And when in course of time the general land laws are extended over it, the nature of the country and the peculiar climate and the requirements of the population will prevent to any great extent the laying out of the land in sections of a mile square. Thus, while no school fund is practicable for years from the lands, the General Government derives a regular revenue from the Seal Islands and other sources, a portion of which could be used in the place of the proceeds of the sale of school lands.

CONCLUSION.

In conclusion, much praise is due the noble band of teachers in the Government schools, the majority of whom are isolated from cultivated society, without comfortable school-rooms, unassisted either by a friendly public sentiment or the strong arm of the law, in daily contact with dirty and often diseased children; in more or less personal danger from the fanaticism and superstition of the people; many of them away from regular mail communications and some of them with only an annual mail. Their courage, their perseverance, their tact, their zeal is heroic.

Very truly yours,

SHELDON JACKSON,
United States General Agent of Education in Alaska.

CHAPTER VII.

DISCUSSION OF QUESTIONS RELATING TO CITY SCHOOL SYSTEMS.

Introduction—Substitute Teachers—The Departmental Plan in Elementary Schools—Thoroughness—Half-Day Sessions—Methods of Determining the Fitness of Pupils for Promotion—Examinations as a Basis of Promotion—Primary Schools—Age for Admission to Primary Schools—Physical Training—Summer Schools—School Buildings—Pernicious Methods of Heating School-Houses—Irrregularity of Attendance—Discipline—Incorrigibles and Habitual Truants—Suburban Schools—Evening Schools—Statistics of Enrolment and Attendance in Evening Schools.

INTRODUCTION.

The topics discussed in this chapter refer principally to the administration of school systems; questions which relate to methods and subjects of instruction, courses of study, etc., have been reserved for the Report of 1888-89, in which they will be treated more fully than the limits of the present Report permit.

These discussions are designed primarily to show the status of various questions which affect the progress of public education. The facts stated and the opinions quoted are taken almost without exception from the official reports of city superintendents, as they are by far the most reliable and generally the most accessible source of such information. These reports emanate from responsible officials, and the accuracy of the statements they contain may be relied upon. They are made to boards or officers upon whose approval re-election depends, and are therefore not likely to give expression to hastily formed opinions, or to contain ill-considered recommendations.

It being intended to make this chapter reflect as far as possible the prevailing sentiment upon the subjects touched among men actually employed in educational work, and in contact with the schools, the expression of any opinions except those ascribed to such men is generally avoided. It must not be understood, however, that the Bureau of Education approves the specific recommendations made in each case.

SUBSTITUTE TEACHERS.

With the increased attention to the qualifications of teachers and the demand for improved character of instruction has come a realization of the necessity for well-qualified substitutes to fill the places of regular teachers unavoidably absent. Formerly there was little or no method in the employment of such substitutes. The superintendent was usually authorized to employ any one whose services were available, and deduct her compensation from the salary of the absent teacher. It was even required in many places that the absentee herself employ the substitute, and be responsible for the quality of the instruction given in her absence. Under such systems, or lack of system, vexatious delays in securing temporary teachers were unavoidable, and efficient instruction was out of the question.

The extracts below indicate a wide-spread tendency toward reform in this respect, and contain suggestive hints for those searching for means of improvement.

"The plan of paying the substitutes a regular salary, and requiring them to give all their time not employed in filling vacancies to preparation for teaching was new, and it is a decided improvement over the old system." [Superintendent W. L. Steele, Galesburg, Ill.]

"The committee on examinations prepared a plan which met with the unanimous approval of the board, and by which a certain number of teachers were to be engaged to act as a reserve corps, and to perform duties heretofore discharged by uncertificated substitute teachers. The short experience gained since the adoption of this plan has verified in every respect the predictions of friends of this measure. Principals are cordial in their approba-

tion of the change from inexperienced substitute teachers to the reliable, well-educated, and more mature reserve-corps teachers. Heretofore, when higher-grade teachers were absent, all sorts of shifts were made to take care of the class, because the substitute teachers were of such a character that intermediate and higher grades could not be entrusted to their care. We are now able to provide teachers capable of holding, for a short period, the seventh and eighth grades; and it is not too much to say that the absence of the teacher from her class is no longer an event to be dreaded by the principal. The classes fare very well in the hands of the reserve-corps teachers supplied from the office." [Superintendent W. E. Anderson, Milwaukee, Wis.]

"The method of employing and paying 'substitute' teachers should be made more systematic, and success as a substitute teacher should be made a prerequisite for appointment as a regular teacher. With this end in view, I would recommend that the board of trustees of each ward be authorized to appoint a substitute teacher for each five hundred pupils in the schools of the ward, based upon the average attendance for the preceding year, the annual salary of each teacher to be one hundred dollars. Principals should be required to make to the trustees monthly reports of the character of the work of the substitute teachers, and the city superintendent should report, as occasion may demand, any information bearing upon the same matter. A regular record of all such reports should be kept by the trustees, and preference in appointment given to those having the best records. [Superintendent John Jasper, New York City.]

"The plan adopted by the board this year of employing three extra teachers on half pay, with the requirement to spend the whole of each school day in the class rooms and in such school work as may be required of them by the principal or the superintendent, proved a most helpful provision. Under this arrangement it is now possible for the principals of our large city schools to look after many small but important matters in the different rooms that formerly received but little attention from them." [Superintendent B. M. Zettler, Macon, Ga.]

"The unemployed holders of teacher-certificates constitute the corps of supernumeraries. They are assigned as nearly as possible according to their residence. Each supernumerary has a standing invitation to visit monthly, under the direction of the principals, the schools to which he or she may be assigned. It is believed that this privilege will prove of great value to those who would avoid the mortifying errors of inexperience." [Superintendent Ulric Bettison, New Orleans, La.]

"I am convinced that for the best interests of the school more attention should be given to the qualifications of candidates for positions in our corps of teachers, and especially to the employment of substitute teachers. Every person before receiving an appointment as a teacher should be carefully examined by the proper authorities, not alone as to scholarly attainments, but also in all the requisites of a good teacher. * * *

"I would recommend, therefore, that a competitive examination, under direction of the proper authorities, of all applicants for positions in the schools, be held annually, and that hereafter no person be elected for a first time to teach in the schools of this district, either as a regular or substitute teacher, who has not satisfactorily passed such examination. Furthermore, I would recommend that, as far as possible, all persons elected to permanent positions shall have demonstrated their fitness by substituting in our schools." [Mr. E. C. Willard, Principal of School District No. 1, Westerly, R. I.]

In those cities in which teachers' training schools are in operation, it is usually customary to require substitute work of the pupil-teachers in such schools. Mr. J. L. Terry, the principal of the teachers' training school of St. Paul, Minn., has this to say of the practice:

"Substitute teaching has been a marked feature in our year's work, particularly within the last four months. During the first term we were able to detail certain members of the training class to work with model teachers, subject to summons for substitutes, but later, as the class became smaller and the demand for substitute teachers greatly increased, we were obliged to select from the students in theory those who could best sustain the extra work, equalizing the distribution as far as possible. The result is that the average of substitute work for the year is over three weeks to each member of the class. We do not consider a moderate demand for substitutes any real interruption to our work. We allow for it and accept it as a valuable means for learning to cope with new conditions—a practical lesson in meeting emergencies which a teacher may make even more valuable than uninterrupted instruction in theory. However, we are convinced that a sudden call to work in grades higher than the fifth is a severe tax upon young ladies, of whom our course of study already requires all the work that can well be crowded into a busy year."

THE "DEPARTMENTAL PLAN" IN ELEMENTARY SCHOOLS.

The attempts to adapt the methods of high-school instruction to the elementary grades have not been attended with conspicuous success. No mention has been made of the

subject in the latest annual school reports of San Francisco, Cal., where the system was tried a few years since, and where much was expected of it.

The experiment was also made in Springfield, Mass., in 1887, at the request of the principal of one of the grammar schools. The disposition was apparent to give the plan a thorough trial, for the school controlled by the principal making the recommendation was selected for the experiment. Subsequent reports fail to state the outcome of the movement, and since it appears from the report for 1887 that the teachers of all the schools are to be assigned to separate grades in the usual way, it may be inferred that the plan failed to produce the beneficial results hoped for and was allowed to take its place quietly in the list of unfruitful and abandoned experiments.

The following paragraph leaves no doubt as to the results of the system as tried at Nashua, N. H.:

"The change which the board has made, and which went into effect at the beginning of the present school year—the abandonment of the departmental system in the grammar grades—has proved a wise and progressive measure. There is now less friction in maintaining good order in the school-rooms, the responsibilities being no longer divided. The same is true in regard to scholarship. If a class is doing good work and making commendable progress the credit belongs entirely to the teacher in charge. There is no reason for specialists among the regular teachers of the grammar grades. All who pretend to teach such classes should consider it their duty to be well prepared in all the branches required, not excepting drawing and music. A certain degree of symmetry of ability and attainments is as necessary for a teacher as for a pupil. It will not do to attend specially to any one branch to the exclusion of others equally important, or to consider that being an expert in one excuses an ignorance in another. A specialist's province is not in our common-school branches. A thorough knowledge of all these is as essential to his success as to those of the ordinary individual. Such knowledge is fundamental, upon which all true success beyond must rest. Regarding this change, I have heard no adverse criticism from parents, teacher, or pupil, and I anticipate the best results."

A greater degree of success has attended the efforts made in this direction in Newport, R. I. There the system under consideration has been in use on a small scale for several years and appears to be very satisfactory for the grades into which it has been carried. As described in a report for a former year, by Superintendent George A. Littlefield, it is as follows:

"In the first [highest] two grammar classes, which occupy adjacent rooms connected by a door-way, the departmental plan of instruction has been continued, whereby each teacher, passing to and fro, instructs both classes in certain subjects. The plan greatly economizes the teacher's time and strength, enabling her to present her few subjects most exhaustively and entertainingly."

Mr. Littlefield refers to the matter in reports subsequent to that quoted, in terms of highest praise. It will be observed, however, that this experiment was made under the most favorable circumstances possible, and although the results obtained in this instance may have been of a very gratifying nature, it does not follow that the plan would operate equally satisfactorily if it were introduced upon the more extended basis that the term "departmental instruction" itself implies.

One other city, Oshkosh, Wis., has experimented with departmental teaching during the year. The principal of the Algoma-Streetschool says: "At the request of the superintendent, a change was made on the 1st of March from the usual way of teaching. This change consisted in confining each to the teaching of one study in the several grades, rather than the several studies in one, and was instituted in the intermediate departments. This, in these grades and with us, may be called an experiment, though successfully followed in many higher institutions of learning. The change has caused no great commotion, and the results must be summed up later on."

THOROUGHNESS.

At the spring meeting of the Department of Superintendence of the National Educational Association, at Washington, in February, 1888, Dr. C. W. Eliot, president of Harvard University, read a valuable and suggestive paper entitled, "Can school programmes be shortened and enriched?" The paper attracted a great deal of attention, and was published in full in the last Annual Report of this Office and in the Atlantic Monthly magazine for August, 1888. The importance of the subject, the prominence of the author, and the publicity it received were such that it may be assumed that the essay came to the attention of a considerable proportion, if not a majority, of the school superintendents. It will be remembered that after pointing out the great need of shortening the time devoted to the studies of the elementary schools the essayist made five suggestions as to the best means of securing the object desired. These were substantially as follows:

(1) Better teachers should be obtained by making tenure of office more secure, and by increasing the proportion of male teachers.

(2) The school programme should be made more substantial, and the work made more interesting and attractive to the children.

(3) "Much time can be saved in primary and secondary schools by diminishing the number of reviews and by never aiming at that kind of accuracy of attainment which reviews, followed by examinations, are intended to enforce. Why should an accuracy of knowledge and of statement be habitually demanded of children which adults seldom possess? How many well-educated adults can add long columns of figures correctly or find the least common multiple or the greatest common divisor of six or eight numbers? Nothing but practice can keep one skillful in these exercises, and we may reasonably be grateful that few people are compelled to keep in the necessary practice. Few adult minds retain accurately considerable masses of isolated facts, and it is commonly observed that minds which are good at that are seldom the best minds. Why do we try to make children do what we do not try to do ourselves? Instead of mastering one subject before going to another, it is almost invariably wise to go on to a superior subject before the inferior has been mastered—mastery being a very rare thing. On the mastery theory how much new reading or thinking should we adults do? Instead of reviewing arithmetic, study algebra; for algebra will illustrate arithmetic and supply many examples of arithmetical processes. Instead of rereading a familiar story, read a new one; it will be vastly more interesting and the common words will all recur—the common words being by far the most valuable ones. Instead of reviewing the physical geography of North America, study South America. There, too, the pupil will find mountain-chains, water-sheds, high plateaus, broad plains, great streams, and isothermal lines. The really profitable time to review a subject is not when we have just finished it, but when we have used it in studying other subjects, and have seen its relations to other subjects and what it is good for. For example, the French programme puts a review of arithmetic, algebra, and geometry into the last year. With all his mathematical powers strengthened by the study of algebra and geometry, and with all the practice of arithmetic which his study of mensuration and algebra has involved, the boy returns at seventeen to arithmetic and finds it infinitely easier than he did at fourteen. Further, the French boy has escaped those most exasperating of arithmetical puzzles which a little easy algebra enables one to solve with facility. Many an educated New Englander remembers to this day the exasperation he felt when he discovered that problems in Colburn's Arithmetic, over which he had struggled for hours, could be solved in as many minutes after he had got half way through Sherwin's Algebra. Is it not an abominable waste of the time and strength of children to put them to doing in a difficult way, never used in real life, something they will be able to do in an easy way a year or two later? To introduce any artificial hardness into the course of training that any human being has to follow is an unpardonable educational sin. There is hardness enough in this world without manufacturing any, particularly for children. On careful search through all the years of the public school programmes now in use, many places will be found where time can be saved and strain lessened by abandoning the effort to obtain an exaggerated and wholly unnatural accuracy of work. It is one of the worst defects of examinations that they set an artificial value upon accuracy of attainment. Good examination results do not always prove that the training of the children examined has been of the best kind."

(4) Children should not be retained in grades for which they are too old. The ambition of teachers which tends to keep pupils too long in the several grades in order that classes may appear well in examinations, and the caution of parents to prevent overpressure, should alike be restrained.

(5) The tendency to diminish the time spent in school should be checked; some steps need to be taken in the other direction.

Concerning but one of these recommendations can there be any serious difference of opinion. An entire change must be wrought in the generally accepted theory of what common school education should be before the ideas embodied in the third suggestion will be carried out. Mastery—accuracy—is the one thing insisted upon more than any other, and the greater thoroughness of instruction is held to be the chief advantage that graded common schools possess over private schools. To cite expressed opinions of superintendents in support of this assertion is not necessary. The object of this recommendation was to lead to a radical change of sentiment in a matter concerning which there had been practical unanimity of opinion—not to champion one side of a question already open.

A diligent search has been made in the official utterances of school officers for an echo to the suggestion. But one has been found, that in the report of Mr. A. P. Marble, city superintendent, Worcester, Mass.

Though hundreds of others must have read Dr. Eliot's essay and carefully weighed his arguments, none was induced to abandon his views upon the value of thoroughness. On the contrary, instructions to teachers and school reports generally continue to teem

with injunctions to aim at absolute accuracy and complete mastery of the subjects taught. Nor is it infrequent that superintendents are found who would add still another year to the usual elementary course of eight years in order to increase the thoroughness of preparation for higher studies and to secure greater maturity of mind and body in the students of the high schools.

The remarks of Superintendent Marble are as follows:

"There is high authority for the opinion that pupils ought not necessarily to be detained upon a subject till it is completely mastered; in other words, that it is quite possible to over-do in the matter of thoroughness. If a pupil is to be kept in a class or a grade, and upon a certain part of a subject, till he knows absolutely all about it so far, he would never advance; for the complete comprehension of arithmetic, for example, is not possible without a knowledge of the higher mathematics; and the elementary knowledge of grammar is not perfect till it is illumined by the light of a broader knowledge. All elementary knowledge appears to be incomplete. Now, with only an imperfect apprehension of the earlier steps, it may sometimes be better for a pupil to advance, trusting to future study to let in the light upon what is now dim, than to keep him groping too long in this dimness for the light, and thus to destroy his interest. It may often be better to promote pupils who are not fully "prepared," than to keep them back. Idleness, indifference, carelessness, are bad habits, which ought to be corrected; but it may well be doubted whether the best cure for these evils is a refusal to promote. Fear of not being promoted is not the best spur to activity. If no other means can be devised to arouse the indolent, it is quite doubtful whether this will do much good. What is here said about the extreme of thoroughness must not be understood as giving countenance to carelessness or a slipshod kind of study or teaching. By creating an interest in study, and by the very best presentation of every subject taught, the minds of pupils should be directed and led, and made alert and active so far as possible. But, after all has been said and done, there will be many pupils by whom a part, greater or less, will be but feebly comprehended; and the question is, whether they should be detained at this particular stage till they understand and can do as well as the rest, or whether they should pass on.

"In general, it is useless to attempt to bring all up to the same degree of excellence, and it is better to go forward. Our teachers are too conscientious, it is believed, to relax their efforts at all because they know this truth."

HALF-DAY SESSIONS.

There is no doubt that the adoption of half-day sessions in other than primary grades is condemned by a majority of educationists. As to the advisability of their use in the lowest grades there is no general agreement, though it is worthy of note that none of the advocates of the plan are found among the school authorities of the largest cities. In every case in which it has been necessary to divide the classes in these cities into morning and afternoon sections, that necessity has been deplored and urgent recommendations have invariably followed for new buildings in sufficient numbers to restore the schools to their wonted conditions.

The following is from the report of Mr. William H. Maxwell, superintendent of public instruction of Brooklyn, N. Y., for 1887:

"It will be noted that while the number of pupils promoted from the seventh primary grade is larger than that from any other grade, it is smaller in proportion to the average attendance. The cause is easily explained. It is found in the half-day classes organized in many schools. The children attending this grade are younger than those attending any other, and hence their attendance is more irregular. As a consequence, the number of half-day classes is a constantly varying quantity. When the attendance is large a part of the pupils are allowed to come only in the forenoon, the remainder in the afternoon. This system, though never legalized or endorsed by the board of education, has been forced upon the schools by a commendable desire to do everything possible to accommodate all the children whose parents apply for their admission. It is, however, of very doubtful utility. It is questionable, even, whether it serves to any appreciable extent the purpose intended. The statistics show that only about forty-four per cent. of the average attendance is promoted from this grade at the end of each term. This means that the majority of the children are detained in this grade two or three terms. Nor can it well be otherwise while half-day classes are tolerated. If one hundred children, as is not infrequently the case, are placed under the charge of one teacher, it is certainly better, both for them and for her, that she should teach half of them in the forenoon and the other half in the afternoon, rather than that she should try to instruct all of them at one time. But those who come in the forenoon are defrauded of part of their time, while those who come in the afternoon receive only about an hour and a half of schooling each day, and learn but little, if anything. As a rule promotions are made

only from the forenoon division, and the afternoon scholars of one term become the forenoon scholars of the next.

"Since we must judge of the quality of the work in this grade, as in any other, by the number of children promoted, it would appear that nothing is really gained by these half-day classes."

Circumstances have forced the use of half-day schools in Atlanta, Ga., for several years. The superintendent, Mr. W. F. Slaton, has steadily opposed their continuance, and embodies the following in his report for 1887-88:

"The double grades taught in the Marietta and in the Summer Hill schools were abolished in September. They are still retained in Fair, Mitchell, and Houston street schools. It is true that about one hundred and eighty children are seated by this method who would otherwise be deprived of school privileges. But there are many objections to the plan of doubling the grades, among which Mr. Moore, of Fair street school, in his annual report, names the following:

"(1) The plan necessarily shortens the time of both divisions of first grade for one and a half hours daily during a greater proportion of the year. Therefore, it cannot reasonably be expected that these classes will make equal advancement with those classes which are in session full time.

"(2) The dismissal of one class while the other portion of the school is in session, to occupy the same room, must necessarily create some disorder. Many of the children attending these classes are very young and live at a distance from the school. Such require some protection while on their way to and from school—at least many parents think so—and this protection might be sufficiently afforded by older brothers or sisters of the higher grades, could they assemble or be dismissed at the same time.

"(3) The present management divides the responsibility of both teachers and pupils of these classes with regard to care of furniture and property of the school. When damage has been done it is difficult to discover the culprit or hold him responsible.

"(4) Many parents send their children to the afternoon school under protest, and ask that they be changed as soon as a vacancy occurs in the morning class. This is objectionable, for the reason that so many desire seats in the morning school, that to decide in favor of one is regarded as favoritism by other applicants, and as a continual removal of children from the afternoon to the morning class, thereby causing vacancies which must be filled by new and untrained pupils, if filled at all, is a manifest injustice to the teacher of the afternoon school."

"I heartily endorse these objections of Mr. Moore, and hope that at an early day a sufficient number of seats for all the children will be supplied, and the plan of doubling the grades be abolished."

The experience of the Los Angeles, Cal., schools is thus told: "At the close of last school year we were conducting, for want of room, eighteen double sessions, that is, two schools taught for half-day each by one teacher. This was unsatisfactory. Pupils in these schools could not do the same work as those who had all day sessions. Teachers often overwork themselves to get these schools, for the additional salary. The board (your predecessors) therefore resolved to employ a separate teacher for each school and to extend the time for half-day schools to four hours; or from 8.30 a. m. to 12.30 p. m. for morning schools and 1 p. m. to 5 p. m. for afternoon schools. This plan is much more satisfactory.

"Children under eight years of age are allowed by State law to be in school only four hours daily. It is believed that the older pupils can do some studying at home. Therefore, whatever half-day schools were necessary they have been given, if possible, to the higher and lower grades."

Favorable opinions.—The following extracts present the other side of the question:

"Our primary grades that attend school but one session a day continue to do satisfactory work; and the advantages derived by the small children from the short period of confinement in the school-room and the increase of time for recreation and outdoor exercise warrant the continuance of the plan. Three hours of school-room restraint and discipline is all that should be required of the average child during the first two years in school. More than this in many instances often proves a detriment, and not infrequently results in permanent injury to many children." [Superintendent E. Stanley, Lawrence, Kans.]

"Children of five years of age cannot profitably be taught more than three hours a day, and the instruction should be in the kindergarten. Fortunately for the little ones and for our educational system, necessity has driven us to the proper pedagogical position in this matter, for the crowded condition of most of our schools has made it necessary to divide the lowest classes into two sections, each to attend a half-day, and the instruction consists mainly of kindergarten work." [Superintendent Clarence E. Meloney, Paterson, N. J.]

"The plan of having pupils in the first primary rooms attend school during the fall

and spring months but half the day has worked well. In many cities this plan is in force and is found to be favorable for the young pupils, and at the same time economical. The large influx of little ones in the fall fills up the rooms to a crowded condition. The storms of winter cause large numbers to be dropped. These remain absent till pleasant weather in spring, thus making light schools in the winter months, if advancements had been made to provide seats for all on entering the school. The continuance of the plan is recommended." [Superintendent O. C. Scott, Oskaloosa, Iowa.]

"Hereafter, the pupils of the first year will attend but half a day instead of all day as heretofore. This change was recommended not in the interest of economy alone, but in the belief that the children can accomplish all the work usually required of them by the 'half-day plan,' and, furthermore, that it is a physical injury to the children to keep them confined in the school-room six hours per day." [Superintendent F. M. Draper, Atchison, Kans.]

PROMOTIONS.

The wide-spread interest in the subject of promotions has led to the compilation of the following description of the methods of determining the classification of pupils in the largest cities of the country. Those of the first and second classes (or claiming a population of more than 100,000) have been selected, as they, in theory if not in fact, command the services of the most competent and best equipped of the teachers' profession and presumably employ the most approved methods in all branches of school work.

San Francisco, Cal.—Yearly written examinations have been dispensed with and all promotions are made by the principals and class teachers, subject to appeal to the superintendent on the part of parents dissatisfied with the non-promotion of their children.

Washington, D. C.—"Pupils are promoted from grade to grade below the high school, and from the grammar schools to the high school, on the recommendation of the teacher and the approval of the supervising principal in charge." Examinations have no reference to promotion.

Chicago, Ill.—"In primary and grammar grades promotions are made by the principal, with or without special examination, in his discretion. From the grammar to the high schools pupils pass on recommendation of the grammar principal. The superintendent holds a supplementary examination for those not recommended. Classes in the high schools pass in course, unless some individual pupils have shown themselves unequal to the work."

Indianapolis, Ind.—"Pupils are promoted twice each year. They are examined upon printed questions originating with the superintendent of schools. All who pass a creditable examination upon these questions are promoted without further question. All pupils who fall low in per cents., but whose daily work has been satisfactory to the teacher in charge, and to the supervisor in immediate charge of said teacher and pupils, are passed upon the recommendation of those two persons—the greater stress being placed upon the teacher's estimate as being the more definite and intimate. All pupils who fall low in per cents., and who are not recommended by their teachers, are 'demoted,' and must repeat the half-year's work."

Louisville, Ky.—In the district or elementary schools: "The teachers of the several grades make and record monthly an estimate of each pupil's progress. These estimates are based on the success with which the pupils perform assigned work in each subject prescribed in the course of study, and also on the fidelity with which they discharge all their school obligations, including diligence in study, regularity and punctuality in attendance, proper deportment in the school-room and about the school premises, and neatness and cleanliness of person. For this purpose the scale of 1 to 6 is used, the number 1 denoting very bad; 2, bad; 3, indifferent; 4, good; 5, excellent; and 6, without fault.

"The principals of the district schools from time to time subject the pupils of the several grades to such tests, both oral and written, as will indicate their proficiency and progress. They examine and, when necessary, revise the monthly estimates of the teachers.

"Pupils whose standing, based on the monthly estimates of the teachers, approved by the principal, is not less than 4 in each subject prescribed in the course of study, and in fidelity in the discharge of school obligations, are promoted at the close of the year to the next higher grades and to the high schools, without examination.

"The fitness for promotion of pupils not entitled to pass on the monthly estimates is determined by an examination conducted as follows: The pupils of the first [highest] grades are examined by the faculties of the male and the female high schools, in the high school buildings; those of the other grades by the teachers of the next higher grades; the questions to be prepared by the superintendent and a committee of principals, viz: three principals of intermediate schools and four principals of secondary schools, appointed by him. An average of not less than 4 in each subject is required to pass."

In the high schools: "There are annually two written examinations of all classes;

the first is held during the last week of January, and the second during the month of June. The results of these examinations, together with the deportment, constitute the data according to which the members of the faculty make up their estimates of the students. The first examination of the first-year class is considered a trial examination; all students who fail to secure at least 4 in each subject of the first-year course are dropped from the class. No student whose combined written average for the year is less than 4 in each subject may be promoted to the next class, or receive a certificate of graduation; nor may any student whose average is less than 4 in more than one subject be re-examined for promotion."

New Orleans, La.—"Graded questions are proposed by the superintendent, and the examinations are, as a rule, under the immediate supervision of the teachers who are to receive the promoted pupils. In the grammar and primary departments the yearly record of each pupil is allowed to have its due weight in determining the question of his promotion; but in the examination for admission to the high school it is not taken into account, except in determining the question of his admission to the examinations."

Baltimore, Md.—The examination system appears to be in use, with the following modification relating to examinations for admission to the high schools and college: "The questions to be prepared by the superintendent, and the examinations conducted by the principals of the several grammar schools. All the pupils of the eighth grade shall be examined, and those who fail to pass, but who are nevertheless considered qualified for promotion by the principals, shall be sent to the committees on the college and high schools, respectively, for final action."

In the elementary grades: "The examinations for promotion are annual, but the principals of the schools are authorized to advance, at any time during the year, any pupils who exhibit exceptional intelligence, and who may be able to pursue the studies of the higher grades."

In the Eastern Female High School: "Yearly promotions from grade to grade are made by combining the work of the class-room with the results of the semi-annual examinations, the requirement being a special average of 60 and a general average of 70."

Boston, Mass.—Promotions are made semi-annually. Principals are responsible for promotions from one grade to another in their own schools, but the questions for the examinations for promotion from the primary to the grammar schools, and from the grammar to the high schools, are prepared by the supervising officers. Pupils over ten years of age are generally promoted from the primary schools, even if they fail on examination. The instructor's record of the pupil's work for the year is also a factor in determining promotions. Changes of grade not involving promotion to a higher department may be made any Monday during the year upon the authority of the principal.

Detroit, Mich.—Promotions occur twice in each year. Formal examinations, uniform for the whole city, are made at only two points in the course—on entering the grammar department and on entering the high school. Questions for these examinations are issued from the office of the superintendent. The principals are responsible for all other promotions, and are at liberty to employ such methods as they think advisable. Their usual method is the examination. Individual promotions are allowed, and are of frequent occurrence. The results of the examination for admission to the high school are rigidly adhered to; but, at the discretion of the superintendent, pupils who have passed through the primary school may be admitted to the grammar school even if they fail at the entrance examination.

Minneapolis, Minn.—"No pupil shall be admitted to the high school who has not passed a satisfactory examination in the branches taught in the grammar school. If at the end of the first or any term, he does not maintain a fair position in the classes, he may be reduced to the proper grade. Nor shall he pass from a lower to a higher class except upon a satisfactory examination.

"Before passing from one grade to another, pupils must sustain a satisfactory examination in their previous studies under the direction of the superintendent.

"In the fourth grade an average per cent. of 65, including term examinations, shall be required; in the fifth, sixth, and seventh grades, 70 per cent., including term examinations; and for admission to the high school a general average of 75 per cent., including term examinations, unless otherwise ordered by the superintendent.

"Classes in the high school, grammar, and intermediate grades shall twice a year be subject to a written examination; and any pupil in the high school and grammar grade whose average per cent. shall be below 75 during two successive term examinations, and any pupil in the intermediate grade whose average per cent. shall be below 70 for two successive term examinations, shall be reported to the principal for assignment to a lower class."

St. Paul, Minn.—Before passing from one grade to another, pupils must sustain a satisfactory examination in their previous studies, under the direction of the superintendent. For admission to the fourth grade an average per cent. of 65 is required, with a min-

imum of 45 per cent. in each study; for the fifth, sixth, seventh, and eighth grades, 70 per cent., with a minimum of 60 per cent. in each study; and for admission to the high school, 65 per cent. in each study, with a general average of 75 per cent. Pupils must stand 70 per cent. in a test examination in each topic in arithmetic before passing to the next. No written examinations are held for promotion of pupils below the A class of the third grade. In the first and second grades, individual or class promotions may be made at any time or on recommendation of the principal, and after a satisfactory examination by the superintendent. In all other classes the pupils are subjected to a written examination every eighteen weeks; an average per cent. below 50 in the intermediate grades, or below 60 in the higher grades, is accepted as evidence of the pupil's inability to pursue the studies of his grade sufficient to warrant his reduction to a lower class. Individual promotions may be made by principals of the grammar and intermediate schools at any time.

Kansas City, Mo.—Each grade of the course of the ward, or elementary, schools is divided into three sections of twelve weeks each; and the pupils of each grade are divided into three classes who pursue the studies of the three sections respectively. Promotions are ordinarily made at the end of every twelve weeks, and are based upon daily work and written examinations, but never upon "final examinations." The daily work counts four-fifths, and the written examinations one-fifth in all general promotions. Written examinations are commenced in the first year. Pupils are promoted individually whenever they can do the work of the more advanced class.

St. Louis, Mo.—"All promotions in the district [elementary] schools are made by the principals of the schools, upon the results of oral and written examinations together with the daily work of the pupils. For admission to the high school a written examination upon questions from the office of the superintendent was formerly required; but now all applicants from the district schools whom the principals recommend as being in their judgment qualified to do the work of the high school are admitted without examination. Pupils whom the principals cannot recommend after passing through all the grades of the district schools, are given an examination by the principal of the high school. Very few of these, however, pass the required examination."

In the high school: Promotions are determined by the record of the pupils' class work combined with the results of the semi-annual examinations. In each study three percentages, one for each of the preceding quarter's recitations, and one for the final examination, are averaged, and a minimum of 65 per cent. in each study and a general average of 70 per cent. in all studies are required. For graduation a higher average is required, viz: 70 per cent. in each study, and 75 per cent. for all studies, the marks for the last two quarters of the course combined with that of the final examination.

Jersey City, N. J.—In the high school promotions are made annually. The examination for admission must be in writing. It occurs annually, and is conducted by the principal and teachers of the high school under the supervision of the superintendent and committee on high schools. There is a semi-annual and an annual examination each year. The superintendent, principal, and committee on high schools fix a standard for all examinations, both for admission and promotion, and pupils failing to reach the required standard are assigned to the next lower class or, if members of the lowest class, to the grammar schools.

In the grammar and primary schools promotions are made semi-annually, and not oftener, except by the written consent of the superintendent. In addition to the semi-annual written examinations, and immediately preceding their occurrence, the superintendent and principals carefully inspect all the classes and record their condition in books kept for that purpose. Reductions in grade may be made at the discretion of the superintendent.

Newark, N. J.—Examinations are held at least twice in each year under the direction of the committee on examinations, with the superintendent. An examination for promotion and graduation is held in all the schools during the month of June in each year under the direction of the committee on examinations, with the superintendent; and all grades, from the first primary to the first grammar, inclusive, are examined in the same manner and under uniform regulations. In conducting and ascertaining the results of any examination, the city superintendent may require the aid of such teachers as may be needed.

Brooklyn, N. Y.—Semi-annual examinations, promotions, and graduations are the rule. The superintendent may at his option prepare the questions for the examinations of all the grammar grades, but he must prepare those for the graduation examinations. Promotion of pupils is based solely on the record of scholarship for the term and at examination combined.

Buffalo, N. Y.—No pupil may be transferred from one grade to another higher, except after examination. At the end of the first term in each year, the teacher of each grade must present for examination such pupils of that grade as shall, in his or her judgment,

possess the requisite qualifications to enter the next grade above, and during the last two weeks of the second term in the year, all the pupils of each grade are examined, and those who are found qualified are promoted to the grade above. The principal of the school conducts these examinations under the direction of the superintendent, whose decisions as to promotion are final.

New York, N. Y.—To be graduated from the grammar schools, pupils must pursue the studies of the highest grammar grade for one year and pass in those studies an examination satisfactory to the principal of the school. Candidates for admission to the Normal College or the College of the City of New York must pass an examination conducted by and satisfactory to the faculty of the institution to which entrance is desired. Promotions are made from the primary to the grammar schools semi-annually, and not oftener, except by written permission of the city superintendent. No pupil may be promoted from any primary school unless examined in all the studies of the highest grade of the primary school, and found qualified by the principal of the department into which the promotion is to be made.

In the grammar grades, every examination for promotion to a higher grade is preceded by a thorough review of all the studies of the grade from which the promotion is to be made. The principals examine all their classes in the prescribed branches of study at least twice a year, namely, immediately before each regular promotion.

The students of the College of the City of New York are subjected to two examinations each year. The first is oral, and occurs in January; the second is mainly in writing and takes place at the close of the second term, in June. The results of these tests are carefully considered by the faculty, who decide upon the question of the advancement of each student. Both oral and written examinations are conducted in the Normal College also.

Rochester, N. Y.—The promotion of pupils in each of the three lowest grades depends upon the judgment of the principal and grade teacher. In the higher grades, examinations principally are relied upon.

Cincinnati, Ohio.—“(1) There shall be no stated examination for the promotion of pupils in the several grades of the district and intermediate schools, but the pupils in these grades shall be promoted and classified primarily on their proficiency in the several branches of the course, as shown by the teachers' estimates of their daily work. A satisfactory standing in daily work, with good deportment, shall be accepted as evidence of the ability of pupils to do successfully the work of the next higher grade.

“(2) It shall be the duty of the teachers in F, E, D, C, B, and A (*not* in grades H and G) to make and record monthly a careful estimate of each pupil's work in the several branches *for the month*, and to average these recorded estimates twice a year—in February and in June. These estimates are to be based on the fidelity and success with which pupils do assigned work, and also on their success in meeting the various oral and written tests which are employed as an element of teaching, and they are to be made by teachers *without the daily marking of pupils and without the use of monthly or other stated examinations for this purpose.*

“These estimates of the daily success and progress of pupils are to be made on the scale of 1 to 10, the number 4 and below denoting very poor work, 5 poor, 6 tolerable, 7 good, 8 very good, 9 excellent, and 10 perfect. In recording these estimates the initial letters may be used, or, if preferred, figures, as follows: *Perfect*, Pr. or 10; *excellent*, E or 9; *very good*, G or 8; *good*, G or 7; *tolerable*, T or 6; *poor*, P or 5; *very poor*, P or 4. Any standing below P or 4 may be recorded as a failure (F or 3 to 0). It is suggested that the standing of pupils be primarily estimated as *excellent*, *good*, or *poor* and then modified, provided the higher and lower estimates can be readily made. The proficiency of pupils in writing, drawing, and music may be estimated on the above scale twice a year—in February and June.

“(3) It shall be the duty of principals to subject the pupils in the several grades, from time to time as they advance in the course, to such oral and written tests as will indicate their proficiency and progress, and be helpful to teachers and pupils, and to this end, the year's course in the several branches may be conveniently subdivided and special reviews and other tests be instituted as the classes advance from one subdivision to another. The tests in grades H and G should be chiefly oral, the exceptions being the tests of written exercises, and in all the lower grades written tests should not be employed to determine the results of oral instruction outlined in the syllabus, or to test skill in the several school arts.

“It shall also be the duty of principals to examine, and, when necessary, revise the teachers' monthly estimates of their pupils' proficiency, and to approve of the same when averaged in February and in June. They shall give teachers such instruction and other assistance in estimating the proficiency and progress of their pupils as will secure requisite uniformity.

“(4) At the close of each school year the pupils in grades F, E, and D, of the district

schools, whose standing (as above determined) in reading, spelling, language, arithmetic, geography, writing, drawing, music, and German (if studied), is good, very good, excellent, or perfect (7 and above), with good deportment, shall be promoted to the next higher grade without examination—the pupils in grade D by the superintendent. The pupils in grades C, B, and A, of the intermediate schools, whose standing in reading, spelling, arithmetic (mental and written), geography, English grammar, composition, United States history (grade A), writing, drawing, music, and German (if studied), is good and above (7 and above), with good deportment, shall be promoted to the next higher grade without examination—the pupils in grade A by the superintendent.

"Pupils in either district or intermediate grades, whose standing in not more than *three* branches is below good (or 7), and in not more than one of these three branches is below tolerable (or 6), may be promoted, provided, that all these lower estimates are not in the daily and more essential studies; and provided further, that their habitual diligence in study, taken in connection with their proficiency in the other branches, constitute satisfactory evidence that, if promoted, they will do successfully the work of the next higher grade. A pupil's fitness for promotion is not to be determined by making a general average of his standing, but by his standing in *each* of the several branches as above indicated. The pupils in grades H and G are to be promoted without written examinations and without monthly estimates.

"In case the parent or guardian of a pupil is dissatisfied with his or her non-promotion, such pupil's fitness for transfer shall, on the application of the parent or guardian, be determined by a *written examination*, the results to be considered as *additional* evidence of the pupil's proficiency; and, in case the parent or guardian is still dissatisfied, it shall be the duty of the principal to report the case, with all necessary information, to the superintendent of schools."

Cleveland, Ohio.—The school year is divided into two terms, and the promotions are made at the close of each term. Pupils in the first half-year of any grade are said to be in the second or lower division of that grade, and those in the second half-year are in the first division. In all grades below the high school, promotions are made from the second to the first division without examination, unless those who are not recommended for promotion desire to take the examination. If such pupils reach a suitable standard in examination they are given a trial in the higher division. In passing from one *grade* to another, however, all are subjected to an examination, which counts for only half in determining the pupils' qualifications for promotion.

Allegheny, Pa.—Each principal is responsible for all promotions in his own school, but the superintendent determines the fitness of those pupils who desire to enter the high school. The tests in all cases are oral and written examinations combined.

Philadelphia, Pa.—Promotions from the primary to the secondary and from the secondary to the grammar schools are made semi-annually. Such promotions are subject to the direction of the superintendent, except that the promotions from the B to the A classes¹ of the grammar grades shall be under the direction of the principals or supervising principals of the schools containing grammar grades. All promotions from the primary to the secondary schools are made only on the averages obtained at the semi-annual examinations. Promotions from one grade to another of the same school may be made at the discretion of the principal. The examinations are mainly in writing and occur semi-annually. Pupils who complete the studies presented for the "senior class," and obtain general averages of not less than 70 per cent. on final examination are entitled to diplomas.

Pittsburg, Pa.—"The principals of the several schools have full charge of promotions from grade to grade, except those from the highest grammar grades into the high school. In some of the schools promotions are made from class standing of pupils, in some by written examination, and in others by oral examination. Admission to the high school is by written examination, conducted by the superintendent and the high-school faculty, in orthography, reading, writing, drawing, arithmetic, geography, grammar, and history."

Providence, R. I.—"During the first five years of school life, pupils are promoted from grade to grade solely upon the judgment of their teachers. During years six to nine, inclusive, upon the united judgment of the teacher and the principal of the school, based upon daily work (determined by occasional marking of test exercises) and upon semi-annual examinations, the work counting two-thirds and the examination one-third in this estimate. In the high school the same method is pursued. Pupils whose daily work is credited at 80 per cent. or above are not subjected to the semi-annual examination. Pupils who have been twice over the work of any grade are promoted without reference to their record."

Milwaukee, Wis.—It is the duty of the principals to report to the superintendent the results of all examinations for promotion within a week after their occurrence, together

¹ Each "grade" is divided into a B and an A class, representing the first and second half-year's work, respectively.

with duplicate copies of the records of the pupils' regular work during the time they have been in the grade, and with specimens of the penmanship of the pupils examined.

No promotions are made until the examination and record of pupils' work have been approved by the superintendent, and the promotions authorized by him. The basis of the regular class promotions is an average of credits obtained by the pupils in the final examination and in their regular work during the time they have been in the grade. An average of 70 per cent. of the combined standings in each of the subjects of reading, penmanship, and arithmetic, and an average of 70 per cent. in all other studies, entitle pupils to promotion, but those who fall below this standard may be promoted if upon re-examination they obtain a standing of 70 per cent. in each of the studies mentioned.

Pupils completing the full course of instruction in the elementary schools and obtaining in the combined record of grade work and final examination an average of not less than 70 per cent. in each of the studies of reading, language, spelling, and arithmetic, and an average of not less than 70 per cent. in all other studies, and who obtain not less than 50 per cent. of the maximum standing in either of the records of work and examination respectively, receive certificates entitling them to admission to the high school.

"The superintendent may exempt any pupils from examination and grant promotions or certificates to said pupils upon such written vouchers and upon such records of the pupils' work, presented by the principal and class-teachers, as shall be in his judgment a satisfactory evidence of the fitness of such pupils for promotion without resort to examination."

EXAMINATIONS AS A BASIS FOR PROMOTION.

The discussion of the examination question has continued during the year with unabated vigor, though it is apparent that the movement opposed to examinations has reached a point beyond which its progress must be slow indeed. It may be true, as one enthusiastic advocate of the "teacher's estimate" system has said, that "examinations for promotion will soon be things of the past—an unpleasant memory," but it is not likely that such a condition of affairs will exist for a number of years at least. A large number of sturdy believers in the efficacy of examinations must be converted or removed from their present commanding positions before it may be expected to witness the final decease of the examination system.

In the last Education Report, extracts were presented showing in what esteem the written examinations are held in Boston, Philadelphia, and other cities. The following paragraphs show the favorable opinions of a number of other officers controlling systems of various degrees of importance:

"Examinations of too great frequency, or improperly conducted, or when made the sole test of advancement, may be hurtful, and give plausibility to the charge of cramming; but as a means of putting a pupil to the test, and of compelling him to reduce to written form his knowledge on the subject of his studies, they are almost invaluable and should not be banished entirely from the schools." [Mr. J. E. Sater, president of the board of education, Columbus, Ohio.]

"The semi-annual examination for graduation serves a most important purpose in the school economy. It constitutes a standard toward which all—both teachers and pupils—may strive; it unifies the work of the schools; it prevents unfit pupils from being graduated into the central school; and it is one of the most powerful agencies in the hands of the superintendent by which to discover and correct abuses and deficiencies in teaching." [Superintendent William H. Maxwell, Brooklyn, N. Y.]

"The superintendent has for two or three years had a special examination under his personal supervision, in order to ascertain the exact condition of each class. Experience has proved that this is the most valuable of all the examinations, and acts as a powerful stimulus on both teachers and pupils." [Report of the Public Schools of Savannah, Ga.]

"There are at least two direct and highly beneficial advantages arising from the judicious use of written reviews. They are the one thing needful to reveal to teachers the lamentable and unaccountable misapprehension which some pupils are constantly getting in regard to their studies, from both their own efforts and the instruction of their teachers. Written reviews also promote exactness of thought, definiteness of conclusion, and cultivate the power of clear and concise expression. Indirectly they are, when wisely treated, great helps in creating an earnest and high moral tone in the school, and thus often become efficient aids in securing good discipline." [Superintendent W. E. Buck, Manchester, N. H.]

"It is quite the fashion in certain quarters to denounce the written examination as putting too severe a strain upon the pupils, or as inducing a mechanical sort of work on the part of the teacher. It is true that written examinations may be so conducted as to do harm, and so any other good thing may be abused; but these examinations as they have been carried on in Hingham are a help to teachers and pupils. It is a good thing for a merchant to take account of stock at the end of the year, to balance his books and

see how he stands with the world; it is a good thing for a school-boy once in a while to be called upon to tell definitely what progress he has made, what power he has gained in the time that has passed. The examinations may be used to spur a lazy pupil, without unduly urging the one who studies faithfully; they make very good exercises in the use of language; our pupils do not worry nor fret over them; on the contrary, the children themselves see in the examination a means of finding out whether they really understand what they have studied." [Superintendent L. P. Nash, Hingham, Mass.]

"These examinations are in writing on the subject studied, and are intended to ascertain how much the pupils have been benefited, rather than how much they remember. I have found them valuable; they serve to show improvement and deficiencies. The attention of the teacher is called to both." [Superintendent F. E. McFee, Woonsocket, R. I.]

"After all the agitation on the subject of examinations for promotion has had its day and the atmosphere has been cleared of the smoke of the conflict, I predict that the examination, by some other party than the teacher of the class, will survive as a prominent factor in determining the promotion and classification of pupils. It may not be difficult to conceive an ideal condition of things in which such means would be unnecessary and useless, but that condition does not now exist and, I am afraid, will not exist this side of the millennium." [Superintendent A. T. Wiles, Covington, Ky.]

"Well-conducted written examinations, at suitable intervals, furnish to teachers and pupils reliable information upon various matters which it highly concerns them to know, and which could be obtained by no other means. They reveal to pupils their deficiencies and acquaint them with the accuracy and *permanency* of their knowledge and their ability to express, in writing, what they have labored to acquire. They furnish teachers with the desired information concerning the knowledge or ignorance of their pupils of the subjects pursued, and reveal to them also the efficiency and defects of their own instruction." [Superintendent J. H. Davis, Somerville, Mass.]

Opposing views.—Dr. E. E. White, now superintendent of the Cincinnati (Ohio) schools, is pre-eminently the leader of the anti-examination crusade, and it is but proper to quote his utterances at some length. In his last report is the following:

"In considering, from a wider survey, the evils resulting from stated written examinations when used to determine the promotion and classification of pupils, and to compare schools and teachers, I once used these words:¹

"They have perverted the best efforts of teachers, and narrowed and grooved their instruction; they have occasioned and made well-nigh imperative the use of mechanical and rote methods of teaching; they have occasioned cramming and the most vicious habits of study; they have caused much of the overpressure charged upon the schools, some of which is real; they have tempted both teachers and pupils to dishonesty; and last, but not least, they have permitted a mechanical method of school supervision.

"It is not asserted that these results, especially in the degree here indicated, have universally attended the adoption of the "examination system." These tendencies have been more or less effectively resisted by superintendents and teachers, and they have been measurably offset, in some instances, by other measures, as the considering of the recitation record of pupils; but the testimony of educators, competent to speak, confirms the writer's experience and observation, and inside facts show that the above indictment of the system, when used for the purposes named, is substantially true. In the very nature of things the coming examination with such consequences must largely determine the character of the prior teaching and study. Few teachers can resist such an influence, and, in spite of it, teach according to their better knowledge and judgment. They cannot feel free if they would. The coming ordeal fetters them more or less, whatever may be their resolutions, and many teachers submit to it without resistance; and this is sometimes true of teachers who have been specially trained in normal schools and are conscious of the power to do much better work. They shut their eyes to the needs of the pupil and put their strength into what will "count" in the examination."

"On visiting the schools I found on every hand these unfavorable influences of the system, and all efforts to secure the adoption of more natural and rational methods of teaching ran directly against this examination wall. I soon became convinced that no satisfactory change in school instruction could be effected while this hindrance was in the way, and the only remedy that promised relief was a radical one—the *disuse of stated written examinations to determine the fitness of pupils for promotion*. But this involved the devising of another method as a substitute, one that would afford relief and, at the same time, secure that degree of uniformity of attainment essential to the proper classification of pupils. The disposition to make a change was enhanced by the discovered fact that the examination system was failing to secure this result—the one specially sought to be attained by it. It was found on inquiry that the lower third of the pupils ad-

¹Elements of Pedagogy, page 199."

mitted to the high schools in September, 1886, were in attainment more than a year below the pupils in the upper third of the class, and a like difference in attainments was found in the classes in the intermediate schools. The very thing that the 'percented examinations' were failing to secure, was needed uniformity of attainment.

* * * * *

"An impression seems to prevail that written examinations have been wholly dispensed with in the Cincinnati schools. This is an error. The written test is no longer made the basis for the promotion of pupils, and it no longer occurs at stated times, but it is continued as an element of teaching, where its uses are many and important. It is now distributed throughout the year and comes without previous notice.

"There is nothing in the new plan that prevents the superintendent from subjecting the instruction in any branch or in any grade or school to such tests, oral and written, as will in his judgment indicate the success of teachers or suggest and promote needed improvement in methods. It is believed that the use of special tests from time to time, the same being unannounced and unanticipated, are much more effective and salutary than a reliance on stated examinations for which pupils may be specially prepared and even 'crammed,' to use a word which, as an educational term, ought to be obsolete. Besides, it is not easy to prepare tests that will disclose imperfections in teaching and, at the same time, be a fair basis for promotion. An examination employed as an aid in teaching and study is one thing; an examination regularly instituted to determine the transfer of pupils is a different thing."

Other arguments advanced upon the same line are as follows:

"Nothing is more delightful to a teacher than to have his work commended, and if by industrious examination we ascertain the parts of each teacher's work that can be justly commended, he will daily seek to make it worthy of praise in all respects. The teacher is daily finding out the attainments of each member of his class, and when the time arrives for promotion, is it not wise, if we would properly grade the schools and stimulate the scholars, to avail ourselves of this knowledge? If the teacher knows that this opinion of his pupils, ascertained through daily contact with them in the classroom, is going to be the most important item in determining the question of promotion, will he not endeavor all the more faithfully to teach his class and manage it so that his work may have the greatest possible effect in getting his pupils ready for promotion? And will not the pupils, who know that their teacher mainly decides upon their fitness for promotion, be more anxious to work so as to deserve their teacher's good opinion? Under the present system there is no doubt of the fact that our pupils are acquiring not only more knowledge than by the old method, but that they are acquiring vastly more power, and what is most desirable, our teachers are encouraged to use better methods of instruction." [Superintendent H. A. Wise, Baltimore, Md.]

"The factitious importance of high per cents., a superstition in which pupil, parent, and teacher join, and which makes it almost impossible for the superintendent so to prepare for the examination as to have its real purpose carried out, makes it a time of excitement injurious in some instances to health, and injurious in all instances to sane habits of study." [Superintendent J. J. Burns, Dayton, Ohio.]

"The plan of admitting to the high school without a special examination has been in operation for twelve years. * * * We are told that with our present method the high school will contain some poor scholars. This is true, and we presume this would be the case in any school under any system. A school is maintained for the benefit of the community, not for the purpose of affording a place where certain good scholars may recite daily. The schools must take the material that is found in the community and work with it. A dull child must attend somewhere. We can not select the class of pupils we desire. We can keep a child for years in one grade, but he cannot be denied the benefits of the schools, even if in the curriculum there are studies in which he fails term after term to pass an examination. We are told also that there will be shirking on the part of many unless the members of the class are driven to their work under the spur of an examination. This is a confession of weakness upon the part of teachers and examiners and a charge of lack of capacity and disinclination to work upon the part of the pupils. Not all who are enrolled upon a school register are capable of becoming good scholars. There are many teachers who are doing good work in the school-room to-day that were unable when pupils to pass a good examination. Their efficiency now, however, is not questioned." [Superintendent J. G. Edgerly, Fitchburg, Mass.]

"It seems wise that, if possible, the instruction in our schools should be freed from the narrowing and mechanical influence of the present system of examinations. Any attempt, however, to relieve the situation by freeing some branches from prescribed examinations might intensify the pressure on percented branches. I believe a large percentage of the teachers are decidedly opposed to that cramming and driving for per cents. and to a narrow-rut, routine method of teaching which these percented examinations necessarily impose on the schools." [Superintendent S. S. Taylor, St. Paul, Minn.]

PRIMARY SCHOOLS.

Each year adds to the importance attached to the training of the first three or four years of a child's school life. In the last Annual Report of this Bureau the subject was touched, and an intimation given as to the increased attention which the lower grades were receiving at the hands of school boards. During the year just past this movement, if such it may be called, has extended until every city in which this Office has a correspondent has been more or less affected by it.

It cannot be said that the full importance of primary schools is yet universally recognized in the substantial matter of dollars and cents, but that importance is certainly realized; and such is the progressive spirit now manifested by school authorities that the realization of a genuine need is almost invariably the precursor of its recognition in the more substantial way.

It may, therefore, be confidently predicted that primary schools everywhere will soon be placed upon their deserved basis of equality, at least, with schools of higher grades, not only in the matter of equipment but in quality of teachers as well.

The extracts below show the reasons for the efforts that are being put forth in this direction, and in a measure, the progress already made toward the accomplishment of the desired end:

"Nearly two-thirds of the pupils attending our schools receive instruction in the primary department. Considering this, together with the fact that here the foundation of their training is laid, and that many pupils finish their education in them, there can be no question of the fact that these schools should receive the most of our care and attention—every convenience should be supplied, and every inducement held out, so that all the children of proper age in the city might be able to avail themselves of their humanizing influence. As they are equipped, organized, and conducted, so will our system be—they are the vital part, and their improvement or decline will in the greatest degree affect the whole system. They should be amply supplied with inviting school buildings, conveniently located, suitably arranged and furnished, and with experienced and well-paid teachers." [Superintendent Henry A. Wise, Baltimore, Md.]

The views of Superintendent A. T. Wiles, of Covington, Ky., are expressed by this quotation from the late Joseph Paine, of the College of Preceptors, London:

"Whatever may be done in the case of those children who are somewhat advanced in their course, and who have, to some extent at least, learnt how to learn, it is most of all important that, in the beginning of instruction, and with a view to gain the most fruitful results from that instruction, the earliest teacher should be an adept in the science and art of education. We should do as the Jesuits did in their famous schools, who, when they found a teacher showing real skill and knowledge in teaching in higher classes, *promoted* him to the charge of the lowest. There was a wise insight into human nature in this. Whether the child shall love or hate knowledge—whether his fundamental notions of things shall be clear or cloudy—whether he shall advance in his course as an intelligent being or as a mere machine—* * * depends almost altogether on the manner in which his earliest instruction is conducted."

"In a system of schools the primary grades are in many respects the most important. In our own city this is particularly so. In these schools, embracing the work of but three years, we have as many children and as many teachers as there are in all the other grades combined, covering a period of ten years of school work.

"For this reason the teaching in primary schools should be of a superior character, and teachers should be selected for them who are fond of children and who have an aptness to teach. At this age children are most susceptible to impressions, and it is in these schools where right teaching is of greatest value, and where poor teaching is most injurious. In advanced grades indifferent teaching may be endured without serious results, provided the child has had the advantages of good mental training in the lower grades, for this kind of teaching may have so trained his mind to proper habits of study that the pernicious effects of poor teaching in advanced grades will be greatly diminished." [Mr. William Connell, city superintendent, Fall River, Mass.]

"The greatest good to the greatest number demands the *best* teachers in the primary or first four years of school life. Seventy-four pupils of every one hundred never go beyond the fourth grade." [Report of the Superintendent of City Schools, Cairo, Ill.]

"The primary department of our schools has received, as it should, the chief consideration at the hands of this board, and it is not too much to say that its efficiency has been doubled within the past few years.

"Among the first measures of reform in school organization in 1879 was the repeal of a system of salaries that did very great injury to this class of schools. No opportunity should be omitted to extend the efficiency of the primary schools; they are the basis of our system, and constitute that portion of it which carries the benefits of education to the largest number of our people." [Mr. Edward T. Steel, president of the board of education, Philadelphia, Pa.]

"My work of superintending has been very much lightened by the action of the board in placing the most experienced teachers in the F grade and by retaining them there. In all good schools much attention should be given to the lower grades, but with such an excellent corps of teachers as the board has placed in the F grade, I am relieved of the necessity of visiting and instructing these teachers." [Report of the Senior Principal, Newport, Ky.]

"These teachers [of the primary schools] are doing their work well. They are keenly alive to its importance. The old idea of placing here inexperienced teachers or persons of ordinary capacities and meager acquirements has no favor with the board of education. No one has more need of experience in dealing with minds than she who has them in charge through the most critical period when they are receiving impressions as lasting as life. The work done has been exceedingly satisfactory in most part, giving evidence of most faithful efforts on the part of the teachers, and corresponding progress of the pupils under their instruction." [Mr. Newton C. Dougherty, superintendent of schools, Peoria, Ill.]

AGE FOR ADMISSION TO PRIMARY SCHOOLS.

This question is frequently discussed, and, like all others, has called forth wide differences of opinion. The growing popularity of kindergartens and kindergarten methods has served to strengthen the ranks of those favoring early admission to the schools, while the general insufficiency of accommodations adds a potent argument to those advanced by the advocates of the other side.

The subject is not a new one, and the reproduction of a considerable number of arguments is unnecessary. The two quotations immediately following fairly show the opposing views of American school-men upon the question. The fact that the two gentlemen quoted, both eminent educationists, held the same position and were surrounded by the same conditions at the times of writing detracts nothing from the interest of the discussion.

"Under the laws of the State, children need be but five years old in order to be admitted to a public school. Of the 70,925 on register in our schools at the close of the year but 2,241 were under six years of age. That there would be a much larger number of pupils between the ages of five and six in attendance upon our schools, if sufficient accommodations were provided, is unquestionably true. The wisdom of permitting children under six or seven to attend school has frequently been discussed. Very many are of the opinion that the age limit for the admission of pupils should be fixed at seven or eight. In discussing this matter in my report for 1884, I said:

"The proposition to exclude from the schools children under six years of age has been made under the misapprehension that it would remove the necessity of furnishing additional accommodation for our primary classes. The 2,639 children from five to six years old in attendance upon our primary classes are distributed among over fifty schools, and their dismissal would not remove the necessity of a new school building in any locality now demanding one.

"A study of the table on page 40 of this report reveals the fact that in the richer neighborhoods of the city there are comparatively few children attending school who are not more than six years old, and that in the poorer neighborhoods there are in most of the schools from one hundred to two hundred between the ages of five and six. It must not be assumed that these young children are simply kept quiet in school and that they do not make any noticeable advancement in their studies. A visit to one of our sixth primary classes will prove the opposite to be true. Children entering school at five, as a rule, complete the first reader before they are six and are able to write numerous words and sentences from dictation. Many of these children are taken from school at an early age, and a law excluding them till six years old would not only shorten their school life but keep them longer upon the streets where those habits and tendencies are formed which seriously interfere with their future usefulness as citizens."

"Such study and thought as I have been able to give this question during the two years since the above was written have confirmed me in the opinion I then expressed.

"In St. Louis kindergarten schools, to which children are admitted at the age of four, are maintained largely at the public expense. It is claimed by those in charge that the pupils who enter these schools at four and continue until they are six have become fitted intellectually to take up the regular grade work, and that they advance more rapidly than children who are admitted to the regular school work without such preparation. If these claims are well founded it would certainly seem to be sound public policy to make provision for the education of children who have reached the age of five or six. The work required of pupils so young should certainly be adapted to their age, but any regulations or law fixing the legal age for the admission of pupils at over five years should be opposed." [Report of Mr. Calvin Patterson, city superintendent of public instruction, Brooklyn, N. Y., 1886.]

"I am of the opinion that it would be judicious on the part of the board of education to pass a resolution to the effect that after a given date, say January 1, 1889, not more than sixty pupils should be placed on register in any class in the public schools. The registers of these lowest classes could, in the mean time, be reduced by simply refusing admission to the youngest applicants. It is not a hardship that a child of five years should be asked to wait until it is six or seven before entering school. Indeed, the majority of educators are now agreed that children should not commence the grade work of the public school until after the sixth year has been passed. For my own part, I am strongly of this opinion. I believe that the average child is injured both physically and mentally by being put too early to the largely mechanical work of learning to read, write, and cipher. Physiological psychology tells us that up to the end of the seventh year 'the inner mental activity gradually develops itself to the point of equilibrium with the receptive functions of sense.' After that date 'conscious design' begins to take the place of instinctive impulse; habits of obedience are formed; memory, imagination, judgment, and reason are developed. To force this development is to outrage nature. To follow nature is the educator's wisest course." [Report of Mr. William H. Maxwell, city superintendent of public instruction, Brooklyn, N. Y., 1887.]

The following is presented as an expression of foreign opinion on the same subject. In their last report the Committee of Council on Education in Scotland say: "Early school attendance is of inestimable advantage, and its use is seen in the later stages of the child's education, where the habits of discipline and attention thus early acquired can not fail to have an influence. Its importance, in view of any technical instruction which it may be possible to introduce into our schools, can hardly be exaggerated. We hope that the feeling in favor of such instruction is growing, and we trust that school managers will do all in their power to foster it, by providing special infant departments, by neglecting no means likely to stimulate their interest in their earliest school work, and especially by giving prominence to such exercises as may develop the faculties of observation, manual dexterity, and general intelligence. It is thus that the infant school may become an effective agency in the work of education, and may, especially for the poorer population of towns, take the place of the early home education open to others more favored. It must not be forgotten that for such children the alternative for attendance at school is neglect and the acquiring of habits which it is difficult afterwards to correct."

PHYSICAL TRAINING.

More attention has been accorded this subject than in previous years, and it can not be doubted that the time is approaching when the full value of physical development will be universally realized.

In discussing the proper age for admission to high schools, Mr. Ulric Bettison, chief superintendent of public schools of New Orleans, La., states: "The impression that our high school juniors are too young for their grade was doubtless produced by a glance at the pupils themselves. Among the number are many past the age of fifteen who are small, delicate, and childish in appearance." This could with equal truth be said of any school in the country, for there is none that has not a considerable proportion of pupils who are unnaturally "small, delicate, and childish in appearance." Such being the case, it can not be supposed that the application of the only real remedy will be long delayed.

In the Report of this Office for 1886-87 it was asserted that "beyond the general calisthenic exercises that obtain in some localities, no provision has been made by any city for the systematic training of the pupils of elementary grades."

This statement is still true, for no city even yet provides systematic physical training for elementary pupils, though important steps have been taken in this direction, as the following quotations show:

For the Hamilton-Street grammar school at Holyoke, Mass., "During the past year a gymnasium has been provided and furnished at a cost of \$102.50. The following is a list of the apparatus: Quarter circle, parallel bars, rowing machine, two pairs chest weights, home exerciser, two pairs swinging rings, one hundred pairs dumb-bells. It is proposed to add to this from time to time if it prove a success. The gymnasium proper is designed especially for the use of teachers and the girls of the ninth and eighth grades. The room is open for exercise before and after each school session. Thus far this work has been purely voluntary. In addition to this work in the gymnasium, each class in the school is expected to be present once in two weeks in the large exhibition hall for practice half an hour in marching and dumb-bell exercise. It is believed that a little work of this kind judiciously and systematically carried on will greatly improve the health of both teachers and pupils, will prevent the tendencies to round shoulders, weak lungs, and listless motions, and thus, by strengthening the body, strengthen the mind."

At Meridian, Miss.: "Owing to the limited space allowed students for physical exercise it has been decided to provide a gymnasium on the grounds. This will give students ample opportunity for the proper development of their physical powers, without which healthy mental growth is impossible."

The building committee of the Madison, Wis., board of education "in their plans for the new third ward and high school buildings have made provisions for suitable and convenient places for gymnastic exercise."

In high schools.—The number of high schools possessing appropriate gymnastic appliances is widening, though not with the rapidity that might have been reasonably expected. The principal of the Portsmouth, N. H., high school says in his last report:

"Within the year there have been added to the gymnasium, with money voted by the boys, a 'tug of war' board and rope, a tumbling-belt, a set of ladders, and a sufficient number of wands for the school in concert exercise. The girls have purchased a supply of rings for their use. In addition to the above the school gymnasium contains, purchased largely by the pupils in the last three years, a wrist-machine, rowing-machine, chest-weights, line rings, parallel rings, trapeze, horizontal bar, parallel bars, climbing-rope, dumb-bells, and Indian clubs. We have, so far as I know, the only and certainly the most complete school gymnasium in the State, and the good results obtained are so marked in so many cases, that I can emphatically say that the money expended by the committee two years ago, and that expended by the school at that time and since, could not have been used to better advantage."

"Besides the general use of the apparatus during the year, class instruction has been given to both boys and girls in club-swinging and dumb-bell exercise. During the present term the girls have made good progress in the use of the rings, and the boys have just begun exercising with wands."

Mr. Zephaniah Hopper, acting president of the Central High School of Philadelphia, incorporates the following in his report for 1887:

"It has always been the aim of the faculty to encourage the students in their athletic exercises. Owing to the absence of a gymnasium, or even a play-ground large enough to accommodate the school, there has been but little opportunity for training and developing the body. However, the students have, in a measure, made up for the deficiency by an athletic association, by which some effort at systematic training is made. During the year, through the courtesy of the authorities of the University of Pennsylvania, two public exhibitions were given on the grounds of the University."

"I have no hesitation in saying that the work of this association has had a decided effect upon the physical development of the students, and, indirectly, has aided the discipline of the school. If the unassisted efforts of the students produce such happy results may it not be wise to give them *systematic training under instruction?*"

In a considerable number of high schools military drill is a prominent feature, and its effects upon the physical appearance of the students have been marked and beneficial. It is conceded to be a means of physical training of great value.

Recommendations.—Among the recommendations in relation to the subject under consideration are these:

"In these days of intellectual high pressure the importance, I may say necessity, for good health and physical endurance can hardly be questioned. As the body is the instrument as well as the dwelling place of the mind, it should be developed and trained to do the best service possible."

"While we have done something, our efforts have been in a large measure defeated on account of limited facilities in the matter of suitable rooms, apparatus, and instruction. The necessity for intelligent and systematic instruction in this subject is admitted by all. How shall it be done? is the question awaiting an answer."

"The first step undoubtedly is to provide a competent instructor to teach and train the pupils of the normal school and the teachers in the schools."

"The next step is to make the best provision as to room that the school buildings and premises will permit. And here I might say that many of the school buildings have ample courts, in many cases warmed, that can very easily be utilized for this purpose, if thought best."

"In the next place, provide such simple gymnastic apparatus as can be well and readily used. All this can be done at small cost and without in any large measure interrupting the present order of exercises. The advantages that this instruction and physical training will bring to pupils and teachers in the development of the body and better health will more than compensate for the required labor and expense."

"This work, of course, should be made a part of the course of study and receive the same supervision and care given to the other subjects."

"I trust the course of study committee will take early steps in perfecting the plan and methods for introducing this course of work into all the schools." [Mr. William N. Barringer, city superintendent, Newark, N. J.]

"We must abandon the class system and all the other unnatural and exacting conditions of study which now apply to boys and girls alike, and introduce a course of physical exercise of equal rank with the mental." [From the Report of the School Committee, Manchester, N. H.]

"Three times a day such calisthenic exercises as are possible in the rooms are practiced. No more is done. Many children grow up without health and physical vigor, who might by proper development be made healthy men and women. Gymnastic apparatus might be introduced in any school with little expense, and its use, properly directed, would be worth more to many boys and girls than any other education you can give them. All this is especially true of girls in the higher grammar classes and the high school. They no longer engage in the vigorous sports of childhood and no physical exercise has been substituted for the active games of childhood. They are at a critical period of life, emerging into womanhood. Whoever looks attentively at a class of girls of this age, sees forms that are growing bent and feeble, and which are losing daily in muscular vitality. What could you give them more valuable than daily training which would straighten the figure, deepen the chest, stimulate the muscles, in short, fill the body with life which would not only give them present health, but would also carry them into later years healthy women." [Mr. Charles E. Gorton, city superintendent, Yonkers, N. Y.]

The president of the board of education of the same city also favors physical culture in the schools, and supplements the superintendent's suggestions with the following:

"Another great want in the public schools is a thorough system of physical development which shall keep pace with the system of intellectual culture.

"Trained minds will avail little in the battle of life without the health and energy which come with a full physical development. * * * Physical exercise should, therefore, alternate with intellectual work during the school hours, and such exercise now forms a part of our course of study. We believe, however, that more attention should be paid to the subject and a better system adopted, a system which will give uniform development as well as the necessary exercise.

"Modern science and ingenuity have developed apparatus and methods which, while they are not costly either in themselves or in the room they occupy, have been demonstrated to be exceedingly efficient. * * * We have included in the estimates for the ensuing year a small sum for the purchase of the apparatus to which reference has been made."

SUMMER SCHOOLS.

There seems to be no good reason why this comparatively new feature should not find its way into general favor. The work that summer schools accomplish is special in its character, but it is none the less important.

There are hundreds of children in every city whose previous lack of school advantages or slower mental faculties cause them to fall behind their classes and remain longer than the allotted time in the several grades. These pupils are required to pass over the same ground for the second time, feeling no interest in the work that is already familiar to them, and suffering the humiliating consciousness of inferiority to their former classmates. As the schools are now organized they lose in this way five or ten months, the time depending upon the frequency with which promotions are made, while in all but extraordinary cases two or even one month's extra instruction would properly fit them for the higher grade. For children of this class the organization of summer schools would prove of the greatest value, and would in many cases lengthen for several years the school life of children who would otherwise be discouraged by failure to obtain promotion and leave school entirely.

Should they continue in school, under the present system they must be provided with an extra term of schooling, and on the score of economy alone the summer school is advantageous, for two months' tuition is certainly cheaper than five or ten.

A pupil's age should have much to do with his classification. A great fault that may be found with the classification of the average city school is the presence in every grade of a number of pupils whose ages are far in excess of the proper age of children of that grade. It is generally agreed that such belated pupils should be advanced toward the grade for which at their age they should be prepared, with as much rapidity as their progress will permit. In the majority of cities the practice of skipping a grade entirely is permitted under such circumstances. This is generally objectionable, because the pupil should be familiar with many of the subjects taught in the grade skipped in order to satisfactorily pursue the studies of the higher grades. But the objections may be obviated by instructing the pupil for a few weeks in the most essential points of the work accomplished by the class which he is to join; and the summer school is the best and most available means of doing so.

Business of nearly every kind is always dull in summer, and numbers of youths who

are obliged to work all winter to sustain themselves are then out of employment. Many of these would eagerly seize any opportunity offered them to improve their minds during their enforced idleness, but cannot attend the regular graded schools, because they are not prepared to take up the work at the exact point reached by any particular grade, and because those schools are just on the eve of closing the year's work when they are ready to begin.

This class is quite large in many cities, and those composing it are entitled to the benefits of free schools and really need them more than those children whose parents are able to send them to school at the usual time. Why should not they be accommodated in ungraded summer schools, and helped in the acquisition of such knowledge as may be gained in the limited time at their command?

At Newark, N. J., vacation schools have been maintained for two seasons for a reason different from any of those mentioned above. That reason is stated by Superintendent W. N. Barringer in his report for 1885, as follows:

"In some parts of the city, comparatively but few of the children connected with the public schools are able to leave the city during this vacation. The parents not being able to furnish private instruction for them, they are consequently turned into the street for nine or ten consecutive weeks. I need not tell you that in a large measure the benefits of the school terms are neutralized by the street habits and influences. * * *

"It seems to be settled that it is not best to curtail the summer vacation. Under these circumstances what shall be done with the class of children referred to? * * * Without further discussion, I would recommend the establishment of at least four vacation or summer schools. * * *

"The main object of these schools is to remove the children from street influences and to preserve their school habits, that they may return in proper condition to their regular school work at the opening of the term."

There seems to be no reason founded upon experience for the fear that the continuation of school duties throughout the summer would prove injurious to the health of the pupils or teacher. As to the latter, they themselves are the most competent judges of their physical condition, and no teacher will forego her usual vacation and undertake extra work in the summer when her condition demands rest and quiet.

The special character of summer schools is such that it is not likely that any school children would be kept in the city by their parents solely to attend a summer school; and those children who do not leave the city would certainly be as healthy in school as at home. Indeed, many of them would be far better off in school, as may be readily believed after a comparison of the unwholesome homes of very many of the pupils, and the school building as it is usually constructed with good sanitary arrangements, large rooms, ample windows, and abundant space surrounding all for the circulation of the air.

Since it appears, therefore, that four distinct classes of children would be benefited by the maintenance of vacation schools, and that the classification of the regular schools would be improved by the same means, may it not be hoped that the subject will in future receive more general attention?

SCHOOL BUILDINGS.

It is not possible in the limits of this Report to treat the subject of school architecture with any degree of fulness or with any attention to detail. The following suggestions of a general character seem to possess unusual merit and are worthy of careful consideration:

"Your attention is again called to the necessity for adopting a plan for a model school building—one best adapted to the needs of our system. Many of our buildings have features in the plan of their construction which it would be well to engraft on all plans for new buildings, while they also have objectionable features; and were we to adopt a model building incorporating in its plan all the improvements in our buildings, while excluding their defects, we would yearly make advance in the matter of our school architecture." [Report of Mr. Henry A. Wise, city superintendent, Baltimore, Md.]

"The city must, within a short time, face the necessity of building schools to supplant the many unfit rented buildings which are a discredit to our school system, and to accommodate the large number of children of school age now deprived of educational privileges. When these are built and ready to go into use, our system should be classified into '*grammar*' and '*primary schools*.' * * *

"Primaries should be located in quiet and healthful places, on large, roomy lots, so as to be convenient of access to small children, and with the plan in view of making some school a central or grammar school, into which the higher grades can be concentrated. By having small buildings, and consequently more schools, they would be nearer the homes of small children, and could be reached by them in bad weather. The records

show that many small children are kept from attending schools, in wide-spread districts, on account of the long distances to be travelled to reach them. No primary building should be more than two stories, and only large enough to accommodate about six hundred children.

"In small two-story buildings there is less danger from panic caused by fire or otherwise. There is less danger from contagion, and more comfort and safety to little children, when in smaller groups and separated from the larger ones. Small buildings can be much better and cheaper lighted, sewered, heated, and ventilated than large ones." [Mr. James F. Crooker, superintendent of education, Buffalo, N. Y.]

"I am convinced that the board of education should condense the schools of the city into a few large¹ buildings. There cannot be a strict discipline of pupils, nor any exactness of grade, when the schools are isolated and scattered over the city in groups of two or three. The teachers in these isolated schools may be ever so faithful and efficient, but they work at a very great disadvantage. The pupils are harder to control, being responsible to no principal, and the teachers are forced to have several grades in one room, thereby losing time and force. The proper policy of our city and of every city is to congregate its schools in large buildings of ten or twelve rooms each. Here an efficient principal can enforce a rigid discipline of behavior, and the assistants feel responsible for nothing but the proper teaching. The children can be reduced to grade, thereby putting all of one class of studies under the care of one teacher. Better work, and more evident and satisfactory results in every respect are thereby obtained." [Superintendent Lawton B. Evans, Augusta, Ga.]

"In any case, the character of the school should be determined before the plans for the building are made. In other words, the building should be adapted to the organization of the school; not the organization to the building." [Report of the Superintendent of Public Instruction of Brooklyn, N. Y.]

"As a matter of financial policy, it would certainly be better for the city to borrow, if necessary, the required sum of money, and erect three or four new school-houses, which would be healthy and comfortable, rather than annually expend a considerable amount for the rent of old buildings which are often unhealthy and unsuited for school use. It can scarcely be necessary to repeat what has so often been said in this relation, that rented houses are seldom fit for occupation by public schools, because they are generally deficient in light, ventilation, and space, which are three essential elements for a healthy and successful school. It is therefore clearly our duty, on sanitary as well as financial grounds, to erect new houses for the schools, until the reasonable demand is supplied, rather than to rent old houses for their use." [Report of the School Commissioners of Baltimore, Md.]

PERNICIOUS METHODS OF HEATING SCHOOL-HOUSES.

Though no system of heating yet devised is entitled to unqualified praise, a few methods still employed in many localities deserve emphatic condemnation. The method described as follows by the acting school visitor of one of the Norwalk, Conn., districts is among these:

"Your visitor would most earnestly call attention to the methods of heating some of the rooms, and especially the two rooms of the higher grades. This is done by furnaces in the school-rooms below, and by means of registers in the floor, the air to which is only that which has been made impure and driven to the floor of the lower rooms! It is carbonized poison, heated to be more effective in its work on the scholars who breathe it again, not cooled and cleansed, but warmed into a new power for mischief. Your visitor was not surprised at the great sick-roll of those rooms. And yet these stoves are old, and the fact was mentioned to your visitor by a person who thought that the evil that had been endured for so long might still be borne! It is not at all clear to your visitor that our bracing east winds do not get credit for the weak lungs of so many of our young people, and for the large proportion of short graves in the adjacent venerable burial-ground that might better be given to these stoves which have been doing their deadly work, it may be, for some generations."

Inasmuch as the use of stoves is quite general, not only in the smaller cities, but in the older buildings of the larger cities as well, the reproduction of the following accounts of tests of their operation is not inopportune:

"Several observations have been taken of the temperature at different desks. In the rooms heated by furnaces and steam the variation in temperature is only a few degrees. But in those heated by wood-stoves it is very great. In severe weather, when a very brisk fire has to be kept, the variation is as high as twenty-five degrees. In one room

¹The word "large" is evidently used here in a relative sense. Buildings of ten or twelve rooms would hardly be called "large" except in comparison with those of only two or three rooms, such as are common in the smaller cities. [Ed.]

the pupil nearest the stove was enjoying (?) a temperature of 92° , while one in the opposite corner was comfortable at 67° . Reducing the temperature to 80° the unfortunate at the back part of the room had to sit shivering at 55° . It has been found impossible so to distribute the heat from these stoves that there should not be a variation of at least ten degrees. If pupils in the back part of the rooms are to be kept comfortably warm at a temperature of 63° , those nearest the stove must endure 78° at least, and for an hour or two in the morning much more. If the rooms were larger the pupils would not be brought so near the stove, but in several rooms not more than three feet intervene between desks and stove.

"Again, the temperature of the air at different heights varies greatly. With the thermometer five feet from the floor registering 72° , one placed two feet lower indicated only 64° , a difference of eight degrees in the two feet, while in many of the rooms the floors are about 50° , varying as the air without varies, and seldom rising above 56° . With cold feet and hot heads, the pupils must suffer in their physical health, to say nothing of the impossibility of doing good mental work. Is it any wonder that our attendance is very irregular from illness?" [Mr. C. H. Morss, city superintendent, Portsmouth, N. H.]

"As stated by the best authorities, a school room should be heated in winter at a temperature not above 70° nor below 64° at the height of the head of a person sitting, and the temperature should not vary more than 4° between that point and two inches from the floor, or between any two points within five feet of the floor. To see how our school-rooms are heated we began in December, 1887, a series of tests of the temperature in the new building in the Upper Village.

"The tests were taken in the following manner: A post was set up in front of the second desk back from the stove, another post was set up in front of the desk in the corner opposite the stove, and another in the middle of the room. On each post there were hung three thermometers, one at five feet, one at three feet, and one at five inches from the floor. By this arrangement there was a pupil who sat nearer and one who sat farther from the stove than any thermometer was hung. The readings of each thermometer were recorded six times a day during school hours, viz: at nine, ten, twelve, one, three, and four o'clock, for six days.

"Similar tests were afterwards made in all the rooms occupied by graded schools, with two exceptions. In the other rooms, however, the lower thermometers were hung two inches instead of five inches from the floor. In the rooms heated by furnace the posts were set, one near the door, one in the middle of the room, and one at the corner opposite the door; in some rooms the middle post was omitted.

"The thermometers were selected to read alike when placed side by side. The tests were being made in different rooms from December 21, 1887, to February 9, 1888. * * *

"The result of these tests has surprised teachers who have taught in the same room for several years, and it will doubtless surprise some of the patrons of the school. The tests show that in the space occupied by the pupil, that is, in the lower five feet of room space, and within the area occupied by the seats, there are marked variations of temperature, not only at different heights from the floor, but at different parts of the room at the same height, and also at the same points at different hours of the day. They show that fires should be started in the school-room stoves at least an hour earlier than at present, in order that the rooms may be approximately comfortable at nine o'clock. They show that one thermometer is no test of the temperature of a room, and that two or more are not when hung at the same height from the floor. In the advanced grammar room, for instance, they show that while there was an average difference of less than four degrees between the temperature five feet from the floor at the front and at the same height at the rear of the room, yet there was at each point an average difference of over sixteen degrees between that point and one directly under it two inches from the floor, and a difference of twenty-six degrees between a point five feet from the floor at the front row of seats and one two inches from the floor at the rear row of seats. They show that in this room there was an average difference of ten degrees between the temperature at the height of the head and that at the feet of the pupils when sitting at their desks, and of over sixteen degrees when standing to recite or to work at the black-board. They show that at the height of three feet from the floor there was an average variation from one observation to another, during the hours school was in session, of over seven degrees. A similar fluctuation in temperature will be noticed in all rooms where the heat is regulated or the room ventilated by opening windows or doors. The tests show that the temperature at the feet was much too cold, being an average of fifty-seven degrees in the front of the room, and a little less than fifty-four at the rear. The conditions in the other school-rooms that are heated by stoves are substantially the same. * * *

"In each of seven rooms post 2 was placed in the north-east corner, and the record shows that in each there is a considerable space that is not warmed sufficiently, particularly in

the high-school room. To make matters worse, in this room, the assistant's room, which is small, is shown by observation to be overheated. The change from the warm air of the recitation room to the cold air of the high-school room is a constant menace to the health of the pupil.

"That pupils who sit in these cold corners complain of being cold is not to be wondered at, and why pupils take cold at school is no longer a mystery.

"The buildings in the out districts can be no better. In one we found a difference of forty-four degrees between the temperature at a desk occupied by a pupil and the coldest end of the principal blackboard, at ten o'clock. Where there are such variations and fluctuations in temperature in the space occupied by the pupils as these tests have demonstrated, the method of heating is radically wrong." [Report of the School Committee of Athol, Mass.]

IRREGULARITY OF ATTENDANCE.

If there is any subject upon which there is universal agreement, that subject is the importance of prompt and regular attendance. The evils of irregularity are fully realized by superintendents, and many are the plans suggested for improvement.

Causes of irregularity.—Since it is always necessary to discover the causes of the trouble it is desired to remove in order to apply the proper remedy, the following extracts are given as representing the results of the investigations of a number of well-informed school officers:

Mr. George A. Littlefield, city superintendent, Newport, R. I.: "There is still too much irregularity in the attendance, and the chief cause of it is the readiness with which children obtain permission from their parents to be absent."

Superintendent O. J. Bainum, Olney, Ill.: "It is still a matter of regret that so many parents fail to recognize the importance of sending their children to school regularly. Too frequently children are allowed to remain out of school for the most trivial reasons."

The opinion that the parents of the delinquent pupils are responsible for the greater part of absences from school is also expressed by the chief school officers of Hopkinsville, Ky.; Putnam, Conn.; Hutchinson, Kans.; Athol, Mass.; Vernon, Conn., and Galesburgh, Ill.

A truant officer of North Adams, Mass., during 1887-88, investigated 557 cases of suspected truancy and found that 123 of the number "were children who had started for school and found they were tardy and turned back, fearing that they would be punished, and for that reason preferred to lose the session, when they could bring in an excuse from their parents." Excepting those detained at home through sickness, this class of absentees was larger than any other.

Superintendent L. T. Regan, Morris, Ill.: "Tardiness usually comes from a want of punctual habits, and not from necessity."

Superintendent John Cooper, Leavenworth, Kans.: "The question is often asked, 'Why do some teachers have so much better attendance than others?' The question is answered in the above, namely: One class of teachers make their schools attractive, pleasant places, while the other class make them unattractive, unpleasant, tiresome places. The hour of dismissal is hailed as the most pleasant."

Superintendent Henry A. Wise, Baltimore, Md.: "This steady and normal increase of attendance upon school duties * * * should serve as an incentive to teachers—if incentive be needed beyond the obligation under which they rest to promote the interests of the schools and the well-being of their pupils—to strive to improve by every means in their power the average attendance of their respective classes. Teachers differ very greatly on this subject. Some, without apparent effort, secure a very high average, while others, under similar circumstances, find themselves unable to bring the attendance of the class up to its normal condition. There are many causes which produce this result. It is very common to hear teachers naming circumstances beyond their control as a reason for a very low rate of attendance, forgetting that an allowance has already been made on account of these very circumstances. When the attendance of a class falls below eighty per cent., ordinary reasons can not be given to account for the fact, and the teacher should examine very closely to find whether the fault is in her stars or in herself. There is one reason that I will mention with the hope that the mentioning of it will produce good results. It is the lack of good disciplinary ability on the part of the teacher. This defect will deplete the attendance of a class more surely than measles or small-pox, and the greatest misfortune is that the depletion becomes permanent. It is a fact that children who have a teacher whom they love and respect for her good qualities recover more rapidly from an attack of sickness than those who are more unfortunately situated. Firm, kind, and methodic control of a class wins the respect and good will of the most turbulent and refractory pupil and creates in him a desire to be present at every session of the school."

How irregularity may be decreased.—"Many of our teachers who have had a low per cent. of attendance are not aware what a power they themselves might be in raising the standard of their schools, and in securing punctuality. It is a fact, undeniable, that the most successful teacher is the one who sees her pupils oftenest in their homes. * * * Visit the parents of your pupils, and by so doing you will show that you have a personal interest in each and every one—that *their* interest is *your* interest. Do this, and I believe your per cent. of attendance will be much better in the terms to come than past records have shown." [Superintendent O. W. Collins, Framingham, Mass.]

"The monthly holiday was established by the board at the suggestion of your superintendent; it has been in vogue for nearly a year. The plan is this: All pupils who are perfect in attendance, 95 per cent. in deportment, and reach within three credits of the class average in the monthly examinations are allowed the last day of the school month as a holiday. The advantages are many. In every class is about a third of the scholars who are always behind and need individual attention; there are always some who, from absence, have missed the vital principles of that month's work. This gives the teacher an opportunity to work up the dull pupils, to assist those who have been absent, and it acts as a severe punishment to the boy or girl who, by disorderly conduct or inattention, has not obtained the required per cent. in deportment, and thus loses his or her holiday. At the same time it serves as an incentive for students to work for that holiday. It has been tried as an experiment, and while all the teachers say it is the hardest day in the month, they unite in saying it is of great advantage to the schools and they would not like to see it discontinued." [Superintendent F. P. Russell, San José, Cal.]

"The means for compelling the attendance of pupils at school are as complete as they can well be made. * * * With a certain small class of pupils these means are necessary and effective in securing their attendance; and by the use of these means these children are compelled to stay in school when they would rather be at play or ranging about the street; and these, after a time, often learn to love the school and no longer need the restraint. But with all these appliances for securing school attendance, the chief reliance is the influence of the teacher in making the exercises of the school profitable and pleasing, and the influence of the parents, who desire for their children the best that is within their reach. To these influences, the good attendance is chiefly due." [Superintendent A. P. Marble, Worcester, Mass.]

"Scholars absent more than three days or tardy more than three times in any school month, without satisfactory excuse, may be suspended by the superintendent until the commencement of the next term." [One of the rules for the government of the American (Ga.) schools.]

DISCIPLINE.

The proper discipline of the school-room and the most effective means of attaining it are subjects whose discussion will always interest those whose life is devoted to the training and management of children. Naturally, a goodly portion of each report is given to observations upon the importance of securing discipline of the right sort, and to suggestions as to the attitude of the teacher toward her pupils. Many of these observations and suggestions are reproduced below. They include remarks relating to the disciplinary ability of teachers, the reasons for maintaining discipline, comments upon the appearance of a well-disciplined school, and, finally, suggestions, more or less original, as to effective means of securing the good behavior on the part of children.

"Correct habits are largely the result of proper discipline; therefore, good discipline is the first essential of a good school, and one's ability agreeably to discipline a school properly is the first mark of his fitness for a position at the teacher's desk." [Superintendent William E. Buck, Manchester, N. H.]

"If a teacher, after a fair trial with a class, has to spend much of her time in talking about order, or has to scold, complain, or threaten to keep down noise and disorder, she has mistaken her calling. The first requisite to complete success is perfect control of the pupils. They must be orderly, attentive, and obedient. No matter how intelligent, enthusiastic, and energetic the teacher may be, if these first conditions of perfect control are not provided, all her efforts will be like applying steam to the locomotive when off the track—instead of progress there are only motion, noise, and danger." [Mr. John Burke, senior principal of schools, Newport, Ky.]

"The only object in the visible discipline of a school is to enable the scholars to study and think to the best advantage. Every useless motion or formula should be avoided, and no pupil should be left for an instant unoccupied. Obedience should be prompt and permanent, but the times of motionless quiet in the school-room, and of requiring pupils to sit erect with their hands folded on the desk, have happily passed, and it is now demanded that there shall be, especially in the lowest grades, a natural hum of business, and cheerful, orderly freedom from unnecessary restraint." ["General Suggestions" in the course of study of the Newport (R. I.) schools.]

"The object aimed at in school is, of course, not merely order, but progress. The former is not the end, but it is a means. It is possible to pay more attention to securing the former than the latter. It is possible to insist on such intense order as to interfere with the pupils' progress in learning. But a reasonable degree of order and discipline is essential, and no satisfactory progress can be made without it." [Superintendent William H. Beach, Madison, Wis.]

"As a rule the children are allowed all the liberty consistent with propriety and progress." [Mr. Ulric Bettison, chief superintendent of public schools, New Orleans, La.]

"The nervous and mental activity spent in legitimate work prepares the otherwise restless pupil for the necessary periods of general exercises or exacted repose; and the result is what the schools, with few exceptions, show—a good amount of stir with a minimum of impropriety." [Report of the School Committee of Chelsea, Mass.]

"Teachers have learned that if they provide suitable occupation for their pupils the question of discipline solves itself. More attention has been given to substance; less to form." [Mr. John J. Jennings, acting school visitor, Bristol, Conn.]

"They control children best who induce them to control themselves; but teachers who attempt to govern their schools by a display of authority are not generally the most successful disciplinarians, and they do not do the best work in the instruction of their schools." [Superintendent A. P. Stone, Springfield, Mass.]

"There are pupils in nearly all our schools ready to take advantage of any weakness they may notice. But on the other hand there are a majority of tractable and well-behaved ones, ready and willing to co-operate with the teacher, and make her work pleasant. But the morsel of leaven leavens the whole, and it is the element of mischief and refraction which the teacher should learn to control if she would succeed. Here is where the 'iron hand in the velvet glove' is needed. The supremacy of the teacher should be made manifest, not by punishment, as in olden times, nor by too frequent displays of authority, but by the exercise of firmness united to kindness." [Superintendent S. S. Taylor, St. Paul, Minn.]

"When the teacher has exhausted his or her own governing power and the pupil persists in setting at naught the teacher's authority, the parents or guardians are fully informed through proper notices. First, a 'warning notice' is sent to parents or guardian. If no improvement results from this course, then a 'special notice' is sent. When a 'special notice' is sent to the parent or guardian, the pupil is not permitted to resume his seat until the parent or guardian shall call on the teacher and give satisfactory assurance of obedience and compliance with the rules of the school." [Superintendent John Cooper, Leavenworth, Kans.]

"The more closely each troublesome pupil is studied, the more fully the impulses that move him are understood, and the influences that surround him out of school are known, the more skilfully can the teacher adapt his discipline to the nature with which he has to deal." [Superintendent H. M. Maxson, Attleborough, Mass.]

"As long as children attend school, they should be treated as children and kept in a child-like spirit. It is not wise to treat them as young ladies and gentlemen as long as their character has not sufficiently matured to entitle them to be treated as such. Certain enjoyments, too, such as parties and balls, should be reserved for riper years. With all due regard for the opinions of children on popular subjects, candidly expressed, they should be given no more weight than they deserve." [Superintendent Henry Raab, Belleville, Ill.]

"It is suggested that children who can not get along in one school might do fairly well in another by being removed from their associates, and the committee recommend that power be given the committee by the board to make transfers on trial as a punishment, but not for the convenience of the pupils or to gratify a whim of the parents." [Committee on Visitation, Paterson, N. J.]

"There is a class of children whose presence among other children or classes demoralizes the school and wears out the patience and strength of teachers beyond all reasonable degree of endurance. Many of this class are marked by a vicious spirit, a reckless license and a gross disrespect for just rights and requirements, amounting to unbearable insolence. The time of children and teachers should not be devoted to these, nor should their malicious and unmanageable examples be tolerated, for it is our duty to shield the other children from such evil influences. We do not ask that these be expelled from our schools and sent upon the streets, but we urge that some provision be made to reclaim them, to restrain and regulate their conduct, by placing them in some special or ungraded school under a teacher peculiarly fitted for such service." [Superintendent O. B. Bruce, Lynn, Mass.]

INCORRIGIBLES AND HABITUAL TRUANTS.

School officers in those States in which compulsory attendance laws are enforced encounter difficulties in the discharge of their duties that are comparatively unknown in

other States. Compulsory laws cause the enrolment of large numbers of children whose previous training is chiefly of the kind that fosters vice, and whose surroundings outside the school-room are only such as encourage a distaste for restraint and an utter disregard for authority. All public schools must contend more or less with this class of pupils, but they are naturally more numerous and troublesome in the schools in which the attendance of all children of every class is compelled. They do not attend at all unless they are obliged to do so, and when forced to present themselves at school they take no interest in their studies, seek only to hinder the progress of others, and take advantage of every pretext to absent themselves from their duties. How to manage such children is one of the gravest questions with which school men have to deal. They must not be excluded from the schools entirely, but their influence tends to demoralize better disposed scholars, if instructed in the regular schools. They should not be committed to reformatories or other institutions for criminals, for they are not criminals, and association with vicious characters can only prove detrimental to them.

The most satisfactory means of dealing with incorrigibles of this stamp is believed to be the establishment of "truant schools," under the management of men peculiarly fitted for such work. The following quotations indicate the reasons for such belief:

"In September, 1885, the truant school was established. The design of this school was to provide a place where the habitually truant boy, the mischievous and ungovernable boy, the newsboy, and the bootblack who must have a portion of school time for their work, where all these could be suitably instructed and firmly controlled.

"The good effects of the school were immediately apparent. Habitual truants and the incorrigible were speedily gathered into this school, and punishment and suspension ceased elsewhere. The good influence of this school was not only felt, but it became tangible in reports. In previous years suspensions for inexcusable absence and for misconduct had averaged about 240; in 1884-85 they were 225; in 1885-86 they decreased to 98, and in 1886-87 to 92, while corporal punishment became a thing of the past.

"There can be no question as to the wisdom of the board in establishing this school, nor as to its restraining and reforming power over all the schools of the city." [Superintendent C. B. Thomas, East Saginaw, Mich.]

"As much less complaint of truancy has reached me than in former years, it would seem probable that the existence of the county truant school has exercised a salutary influence, and though truancy is by no means obsolete in this town, I have no hesitation in saying that the school is of great value in restraining it, and trust that the institution may be kept up." [Superintendent T. H. Day, Pittsfield, Mass.]

"I find that since it has been possible for the town to use the truant school it has been much easier to bring the truants into school." [Mr. Charles L. Frink, truant officer, North Adams, Mass.]

"I also desire to call the attention of the board to the demand for some means of separating the incorrigible and demoralizing class of pupils from those who attend school with unobjectionable habits and morals. This should be done without turning them into the street. My recommendation is that a separate school be established for truants and those who require corporal punishment. One teacher could do this work for the present, and it should be one of the most capable and conscientious teachers obtainable. Pupils should be transferred to and from this school in accordance with such regulations as may be established, and a truant officer should be appointed to assist in enforcing these regulations. * * * I believe this measure would be of great benefit to our schools." [Superintendent D. C. Tillotson, Topeka, Kans.]

"I also recommended that we avail ourselves of these provisions of the statutes, and that for this purpose we invite two or more of the neighboring municipalities to join with us in a petition to the county commissioners for the establishment and maintenance of a school to which truants, and in case the Legislature shall give the requisite authority, those pupils 'who persistently refuse to comply with the reasonable rules and regulations of the schools' may be sent for discipline and instruction.

"Another year's observation and reflection have strengthened my conviction that the need of such a school is imperative, and that the best interests of our schools require its establishment. I again respectfully commend the subject to your consideration." [Superintendent Thomas Emerson, Newton, Mass.]

"The number of actual truants in our school is very small, but the difficulty of dealing with them is just as perplexing as if their number were larger. The absence of a suitable institution for the confinement, discipline, and instruction of habitual truants makes a great deal of work for the truant officers. They have no effectual means of inspiring the boy with a wholesome respect for their authority, and thus to enforce his attendance at school, except the fact that if caught he will be returned to school; nor can the committee devise any means to assist the officers in the absence of a truant school, which are not objectionable because of their dangerous results. Boys who play truant are not criminals, and cannot be treated as such. They stay away from school simply

because they do not like the restraint which constant application to study requires. If they should be sent to the State Reform School, or any similar institution, the stigma upon their character may turn them into the very path from which they should be kept.

"At the same time, their absence from school, wandering about the streets, inculcates idleness and shiftless habits, and leaves them to engage in evil practices which may lead to criminal acts. The scholars who attend school and are inclined to truancy, seeing that the efforts of the officers to return absentees to school are vain, become emboldened, and try playing truant themselves, and the result is to extend the evil of truancy among those scholars who are at first inclined to attend school regularly. So long as public officers dawdle with a question of so much public importance as the establishment of truant schools, we shall be without a remedy for this evil." [From the Report of the School Committee of Marblehead, Mass.]

"The confining in reformatories of children between eight and fourteen years, who have committed no crime, but who refuse to obey parents, and allowing them to associate with older children who have been committed for crime, appears to be a very grave matter. On this account very few children are committed each year.

"To remedy this evil it seems to be necessary that a reformatory school should be established, under the direct control of the board, for the discipline, instruction, and reforming of habitual truants and non-attendants. In this school the children should be taught some business or trade, so that when they leave school they will be fairly equipped to gain a livelihood." [Superintendent John Jasper, New York City.]

"No provision has yet been made for truants and incorrigibles. The superintendent, in annual reports and in monthly communications to the board, has urged the necessity of establishing a school where such persons could be taught and trained. The public-school principals have also advocated such a measure. This question is of vital importance, not only on account of those who need special training, but also, and in larger measure, for the sake of all our pupils whose character depends so much upon their association with each other.

"The great majority of children are obedient and well trained; they should not be in danger of contamination by a vicious element. A city home should be established, to which children who need a special training could be sent for instruction and reformation, but not as criminals for punishment. They should be obliged to live there, undergoing a regular system of duties and instruction, subject to rules appropriate to the institution." [Superintendent Clarence E. Meleney, Paterson, N. J.]

"In my opinion, a special school should be established in this city, into which confirmed and persistent truants should be sent and confined for a reasonable length of time, as a punishment for non-attendance at school. Many parents and guardians who fail to properly discipline their children, either from negligence or want of ability, or who have lost control over them, would welcome such an institution and heartily indorse the plan. It should not partake of the character of a penal institution except in the feature of confinement for a reasonable length of time, and children should be admitted only for truancy or refractory conduct in the regular schools. As soon as an inmate could give a satisfactory guarantee of future good conduct and faithful attendance in his regular school, he should be discharged, and taken into a regular school on probation.

"I believe, as I have said in a previous report, that the knowledge, merely, of the existence of such a school, would largely deter truancy.

"Such a school would never become large, and need not incur a great expense, while its benefits to the school system would be immense in the way of discipline, not only to the truant element of the school, but to the whole department.

"But there is another view of this subject to be considered, and of far more seriousness than the mere absence from school of the truant and his educational loss. It is the moral view. Truancy in many cases is the first step toward the walks and haunts of criminals. Many at first well-disposed children are indulged in 'playing the truant' by kind parents, and, occasionally, by careless or indifferent teachers, until they come in contact with the 'street Arabs,' who skulk from place to place watching for an opportunity to pilfer or commit some depredation, and thus become the tyros of State criminals." [Superintendent James F. Crooker, Buffalo, N. Y.]

"Inexcusable absence, tardiness, and truancy are rife in too many of our schools. This last-named evil is still rampant, for our incorrigibles know too well that until a truant school becomes a tangible entity, or the Lawrence Industrial School can take all of Lynn's truants, they are free to defy all law and order. Some of our citizens view this desire for a truant school as a mere sentiment or convenience on the part of teachers and school officers, believing that it is an effort to rid schools and teachers of a few unruly boys, assuming that if schools are attractive and teachers loving and amiable there will be no truants. We can fully assure all such opinioned advisers that if they will give one week of thorough personal experience to this whole matter, with us who know the 'ins and outs' of truancy, they will find that the attractive school and the amiable,

loving teachers, are sweets that truants do not cry for, do not long for. No person unacquainted with the proclivities of these children and their various conditions and circumstances in a city like Lynn, is qualified to ascribe to mere sentiment or convenience any effort of teachers or school officers to suppress truancy. Our city swarms with habitual and incorrigible truants whom parents can not induce or the law oblige to go to school. * * * They are becoming the worst class of juvenile offenders, some figuring as petty thieves, burglars, and vagrants. Not until Lynn, as a city, insists that the county commissioners comply with the statute requirements, will there be a truant school established, unless Lynn is forced to build one in self-defence, and which it well can do with pecuniary as well as great moral benefit." [Superintendent O. B. Bruce, Lynn, Mass.]

"Provision has already been made for the confinement, discipline, and instruction of habitual truants. Is it not equally important that a law be enacted under which a child who attends school, but who persistently violates the rules and regulations necessary to secure the object for which schools are maintained, shall be dealt with in a similar manner? The truant suffers personal loss when out of school, but does not occasion loss to those who attend; while the persistently disobedient and refractory pupil profits little, if any, by being in school, and seriously interferes with the progress of others. In dealing with such pupils at the present time, the only means available as a last resort is to expel them from school, and by so doing make them companions of the truant, thereby defeating the very object sought to be accomplished. A year ago an effort was made to secure a change in the law relating to truancy, so as to include among the classes of children affected by its provisions those who persistently refuse to comply with the reasonable rules and regulations of the school. * * *

"The importance of securing these amendments can not be realized except by persons familiar with the work of schools. It is often the case that a single boy by his repeated acts of disobedience almost monopolizes the time and vitality of the teacher, and thereby deprives the other pupils of the instruction to which they are entitled. Such boys are the *anarchists* of the school community, and should be treated as the worst enemies of its order and welfare; but the means of dealing with them are insufficient. There can be no worse policy than to let them remain where their presence is a constant injury to others. It is hoped that during the coming session of the Legislature the proposed amendments will be adopted, and the incorrigible pupil, as well as the truant, provided with 'a suitable place' where he can receive instruction without interfering with those who are disposed to make good use of their school privileges. * * *

"By statute all cities and towns are required to provide themselves with suitable places for the restraint, discipline, and instruction of truants. In Cambridge, and in many other cities and towns, the almshouse is the place to which truants are sent. But there is a general feeling that an almshouse is not a proper place for the confinement of this class of children. A truant school should be one of rare excellence, and all the surroundings and influences should be helpful. In the management of our truants at the present time there is no cause for complaint, for the superintendent of the almshouse is an exceptional man for such a position. The objections lie in the character of the place, and in the fact that the school is but an adjunct of the institution, and from the nature of the case must be considered of secondary importance." [Superintendent Francis Cogswell, Cambridge, Mass.]

SUBURBAN SCHOOLS.

In many localities the city board of education must, in addition to the management of the city schools, supervise and, to a certain extent, control the schools in the contiguous country districts. As these schools are usually of a rather inferior character, the following from the pen of Dr. A. P. Stone, city superintendent, Springfield, Mass., is pertinent and to the point:

"There is no good reason why the suburban children should not have as good school accommodations as those in the larger centres of population. And the same remark will apply with equal force to their opportunities of instruction. If music, drawing, and penmanship, well-taught, are desirable for the central schools, so must they be also for those in the outlying districts. The fact that such pupils have their homes remote from the city's business activity, with less opportunity for mingling with their fellows, and for social privileges, rather emphasizes their need of the best schools that can be given them. Neither locality nor sparseness of population should interfere with equality of school opportunities. It is injustice to children to curtail their privileges because their schools are small and expensive. The reasonableness of the expense of schools is not to be decided by the cost of a single school; but rather by the average for the whole city or town, with all due allowance for circumstances. The United States mail delivers many letters in small hamlets at an expense many times greater than the cost of the

stamps affixed to such letters; but while that is true in comparatively small communities, it is also true that, in large cities and towns, where the population is massed, the Government derives a revenue from every letter delivered. The department is judged by its average expenditures and receipts. It may cost more to educate a child at Sixteen Acres or at Dry Bridge than in one of our central schools in the city; but the excess of that cost above the average is more than offset by the difference in the cases of the many whose rate is lower than the average."

EVENING SCHOOLS.

In the accompanying table are shown the number of teachers, total enrolment, average attendance, and per cent. of attendance in the evening schools of 148 cities. Of the 684 cities from which returns were received only these report evening schools. The reasons for the universal complaint of irregular attendance in these schools may be readily understood after an inspection of Column 11 of the table, especially if it be remembered that a low percentage of attendance in evening schools indicates a far more rapid decrease than the same percentage in the day schools would show.

The smallest attendance in proportion to enrolment shown by any city is that of Fitchburg, Mass. In explanation of this, the superintendent, Mr. J. G. Edgerly, says in his report:

"A great many persons attended the evening schools for two or three evenings. Their names were placed upon the registers and they were reckoned as members. Some of the schools were in session three months. This accounts for the small average attendance as compared with the whole number."

And in another connection: "The schools have not accomplished as much as their friends anticipated, for they have not been well graded, the attendance has been irregular, and experienced teachers could not be obtained. More system is needed. Each year's experience aids us."

In regard to the explanation that those who attended only two or three evenings were reckoned as members, and that to this fact is due the low percentage, it may be said that such is the rule in the majority of cities, and ought to be in all city schools of every kind whatsoever. If the number of such pupils is large the assumption is warranted that there is something wrong with the school, and there is no reason worthy of a conscientious teacher for "doctoring" the statistics by excluding those who discover in two or three sessions that the school is neither a pleasant nor a profitable place.

There can be no doubt that the principal reason for the particularly unsatisfactory attendance in the case mentioned lies in the fact that "experienced teachers could not be obtained." The very best teachers find it difficult to make evening schools successful, and if skillful and experienced instructors are not obtained the fate of the schools can not be long in doubt. The experience of every city reporting to this Bureau has shown this to be true.

The inexperience of teachers is not always the cause of poor attendance. The conditions that lead to irregularity can not be removed by the most competent instructors, or by the most careful attention to the comfort of the pupils, and it seems to be certain that a high standard of attendance is unattainable in ordinary evening schools open to all applicants, except, possibly, by the strict enforcement of some law similar to that in force in Massachusetts, of which mention is made below.

Reference to the table will show a number of instances in which the percentage of attendance exceeds 75. It is likely, however, that these high averages are almost invariably due to either some arrangement to prevent the enrolment of all but the most studious, or to some very peculiar method of keeping the records.

New Brunswick, N. J., reports the highest ratio of attendance, 87.7. Examination into the methods by which such a percentage was attained shows that a cash deposit is required of each pupil as a guarantee of good behavior and regular attendance. Further investigation shows that though 1,894 children of school age were not even enrolled in either the private or public day schools, only 57, all told, were registered in the evening schools. But these were quite regular in attendance, progressed well in their studies, and no doubt praised the efficacy of the deposit plan in keeping out "undesirable" pupils.

The passage of the "Illiterate minor bill" by the Massachusetts Legislature has had the effect of greatly augmenting the attendance in and importance of evening schools in that State. This bill forbids the employment of any minor over fourteen years of age who can not read and write in the English language, in any town or city in which evening schools are conducted, unless said minor be a regular attendant of a day or evening school. Even with such a law in force it will be seen from the table that but few of the cities and towns of the State have secured note-worthy regularity of attendance, even in those localities in which the statute is supplemented by the deposit plan. At Worcester, the birth-place of the dollar-deposit idea, the ratio is but 46.5.

The schools of Chicopee, Mass., are worthy of distinguished commendation, for in them the instruction appears to be excellent and of sufficient attractiveness to hold the pupils to their work with remarkable steadiness. The deposit plan is in use, but it is probable that the objections to it are largely obviated by the operation of the compulsory law.

The Lawrence, Mass., schools evidently improved during the session of 1887-88, for the last printed report received by this Bureau gave no intimation of the high state of efficiency indicated by the figures for the past year.

TABLE 19.—*Statistics of Teachers, Enrolment, and Attendance in Evening Schools.*

CHAPTER VIII.

STATISTICS OF CITY SCHOOL SYSTEMS.

Remarks Relating to School Statistics of Cities—Names of City Superintendents—Statistics of Population and School Enrolment and Attendance (Table 20)—Statistics of Teachers, Accommodations, and Salaries (Table 21)—Statistics of School Property and Receipts (Table 22)—Statistics of Expenditures (Table 23)—Statistics of Public High Schools (Table 24)—List of Cities and Towns from which no Statistics have been Received—Remarks Relating to the General Comparative Statistics—Comparative Statistics of Enrolment, Attendance, Teachers, and Sittings (Table 25)—Summary of Same by States, Geographical Divisions, and Classes according to Population (Table 26)—Remarks Relating to the Comparative Statistics of Property, etc.—Comparative Statistics of Property, Expenses for Tuition, and Receipts from Local Taxes (Table 27)—Summary of Same by States, Geographical Divisions, and Classes according to Population (Table 28).

SCHOOL STATISTICS.

Great improvement in the statistical portions of the reports of superintendents is apparent each year. But many incongruities must be remedied and a much nearer approach must be made to general uniformity before perfection in this regard will be attained. There is no lack of interest in the matter, for a desire is manifest on the part of every superintendent to make his statistics as complete and accurate as possible. The truth is that the frequent discussion of the subject has not yet led to a general agreement as to what items should be reported, or to a full understanding as to how deductions should be correctly made.

As the facts elicited by the statistical forms of inquiry of this Bureau are those which have been settled upon by eminent educationists as being of prime importance, and are thought to be easily obtainable in any city, the following explanations are given of their significance and the methods of determining each, in the hope that a better understanding of the subject and greater uniformity may be secured. Reference to Tables 20 to 24 will show the application to the statistical tables of the facts obtained by the inquiries mentioned. The items are taken up in the order in which they occur in the tables.

Total population of the city or town.—Though the school population is the true basis for all school computations and comparisons, it is often convenient to use the total population to show with what other cities a comparison of the statistics of any city may be equitably made. In other than census years it is seldom that the exact total population can be given, and the figures in this column are generally estimates. They should not be used, therefore, in any precise calculations.

Population between the ages four and twenty-one.—These ages are the limits within which school attendance ordinarily lies. As it includes all who could under any but extraordinary circumstances be expected to apply for admission to the schools, the item has its value, though it lacks some of the elements of importance possessed by the next item. It is not usual that children are sent to school before they are at least five years old, and the school life of the vast majority of persons terminates long before they reach the age of twenty-one. But it was recommended by the National Council of Education in 1885, and it is generally conceded, that the legal (permissible) school age be from four to twenty-one; and considerable value attaches to the number of persons entitled to admission, in the opinion of educational experts, if not according to the laws of all the States. It was also recommended that four to twenty-one be the census age as well, and that the age of each child enumerated be noted, in order that the number of children between any ages could be easily ascertained. This suggestion has produced no tangible result, for it is not yet possible to secure the actual population between four and twenty-one, except in the cities for which that was already the census age.

In order to obtain the desired figures, however, recourse has been had to a method described in a previous report.¹ Briefly stated, the method consists in estimating the popu-

¹ See Education Report 1885-86, p. 23.

lation four to twenty-one upon the basis of the given population of the State census age, and in doing this, the ratio to each other of the two quantities as shown by previous National and State censuses is considered. The actual population four to twenty-one in the few instances in which it has been ascertained has coincided almost exactly with the estimates made in this Office, thus proving the latter to be at least near enough correct for purposes of comparison.

Population between the ages six and fourteen.—These ages were decided by the National Council of Education to be the proper limits for compulsory education. As a uniform basis is necessary in comparing cities of different States, it is believed that this is as satisfactory a basis as could be established. It is certainly a more equitable one than the population four to twenty-one, for it is between six and fourteen that the vast majority of children attend school; the course in the elementary schools, which all but a small proportion of the whole number attend, is usually designed to cover that period. The population six to fourteen is obtained in the same manner as that described in the preceding paragraph.

Number of children of school census age.—For cities in the same States or in different States with similar school ages this item furnishes a fair basis of comparison, but its use under other circumstances should be avoided. The figures, unless marked "estimated," are supposed to be obtained by actual count.

Enrolment in private and parochial schools.—In very few cities or towns are the public schools patronized to the exclusion of all others. The extent of the work done by private schools is well shown by the comparative table (Table 25). These schools should be considered in determining the educational conditions of any community, and it is unfortunate that accurate statistics concerning them can seldom be obtained. No attempt is made to secure anything more than their enrolment, and even that is almost invariably estimated.

It is not intended that the number given under this head should include the students in colleges, normal schools, or other institutions of a grade higher than the average high school.

Total enrolment in public schools.—There seems to be no reason for disagreement with respect to this item. To know the full extent of the influence exerted by a system of schools the number of all those benefited by them in any degree should be recorded. The total enrolment includes all children in attendance during the year without regard to the time of their continuance in school.

Duplicate enrolments caused by promotions, transfers, or re-entry in the same year after temporary absence, must not, of course, be included. As evening schools labor under entirely different conditions, and are usually maintained for those beyond the school age, their statistics should in all cases be kept separate from that of day schools. The "average monthly enrolment," "average number belonging," "number belonging at the end of the year," etc., are frequently used in statistical statements, and would be of undoubted value in the national statistics if it were possible to realize the ideal condition of uniformity. As yet their use is impracticable.

Average daily attendance.—The significance of this item is well known. It is among the most important of the facts desired by the student of school statistics. The "average daily attendance" is the average of the attendance for all the days in the year. This seems quite simple to one unacquainted with the variety of methods used in arriving at that average, but a great many superintendents have not yet adopted the following, which is the usual and probably the best method:

The attendance for one day may be expressed as a mixed number if necessary; for instance, if thirty pupils are present all day, three for one-half day each, and three for one-quarter day each, the attendance for that day may be correctly expressed by $30 + \frac{1}{2} + \frac{3}{4} = 32\frac{1}{4}$. In this suppositional case the attendance for the day would be equivalent to the attendance of one pupil for $32\frac{1}{4}$ days, or to that of thirty-two and one-quarter pupils for one day; it is not, therefore, improper to allude to attendance in terms of "days," as well as in terms of "pupils."

The "total attendance in days (or pupils)" of any school for the year would be the sum of the attendances for all the days. The "total attendance in days (or pupils)" for a system of schools, then, is simply the sum of the like quantities for all the schools, and the "average daily attendance" is the quotient obtained by dividing this "total attendance" by the number of days the schools were required to be actually in session.

The rule here given does not in any way conflict with that in use by State superintendents, who obtain the average daily attendance for an entire State by adding the average daily attendances of all the units of school organization, whether they be cities, districts, or counties. It should be remembered that the city is a unit of organization and in all statistical matters it must be treated as such. The frequent changing of residences with the consequent transfers of pupils from school to school, and the practice of opening new schools in the midst of the school year make it impossible to secure strict accuracy of statistics if each school be considered separately.

In any case, actual presence in the schools only should be considered. Those absent from any cause should not be counted as in attendance.

Number of days schools were taught.—In city systems, almost without exception, all schools are required to be in session for the same length of time. The number of days in the year on which the schools are required to be actually in session should be shown under this head; and this number should be used in obtaining the average daily attendance, even if some of the schools be granted special holidays.

Total attendance in days of pupils of all grades.—This quantity shows the aggregate number of days attended by all pupils in the schools reporting it. The method of calculating it was explained under the head of "average daily attendance." The term is not generally understood, for a great many superintendents report the average daily attendance and the number of days the schools were taught, and yet fail to report this item. In cases of this kind the total attendance was determined in this Office by a simple multiplication.

Greatest number of teachers employed in all schools at any one time.—A great deal of trouble has been experienced in framing a question that will elicit the exact information needed in regard to teachers. The form of the question in the inquiries for this Report was not by any means satisfactory, and will be altered in future inquiries. What it is required to know is the number of regular teachers' places provided. The number should not include substitutes nor those whose time is principally devoted to supervision. "Special teachers" are merely supervisors of particular branches of study and should be classed with the supervising and not the teaching force.

Number of public school buildings.—In the column under this head appears the number of different buildings in actual use for school purposes in each city. The fact that a building is rented should not exclude it from the number; but small "annexes" adjacent to, and belonging to the organization of larger buildings should not be counted.

Number of sittings for study in all public schools.—This number indicates the number of seats available for use in all schools. Double desks should be counted as two seats.

Annual salary of city superintendent.—The words of the heading convey the full meaning intended. It is not desired to know what is paid to school visitors in the absence of a superintendent, nor in case the superintendent has other duties to perform, what proportion of his salary is for supervision. The full amount per annum received by the chief supervising officer in payment of all services is wanted. Its use to superintendents and boards of education is obvious.

Free text-book system.—Unless all pupils are supplied with everything necessary to the prosecution of their school work, it can not be said that the free text-book system prevails. The reply to the question upon this subject should indicate precisely the plan in use.

Value of public property used for school purposes.—This is self explanatory. The value of rented premises has no place here, but unused school buildings and vacant school sites may be properly included. Heating apparatus frequently causes trouble in this connection, for many do not understand its correct classification. When heating and ventilating arrangements are essentially parts of a building, there is no reason why their value should not be included in that of the building, like other permanent fixtures, such as gas-jets, bells, etc. If movable stoves are used, a distinction must be made, and their value must be classed under the head of furniture. Scientific apparatus, including such articles as maps, globes, etc., used as aids to instruction is what is intended to be classed with libraries.

Total value of taxable property in city or town.—The use of this item and the difficulties experienced in its application have been frequently shown in previous Reports. The trouble lies in the different bases of assessment in the various States and in the general unreliableness of the estimates, which are usually made without data sufficient to guarantee reasonable accuracy.

Receipts.—The subdivisions under this head represent the items which occur most frequently in reports of school finances, and which show the most important sources from which school moneys are derived. It must be borne in mind that *all* receipts from each of the several sources should be included under its proper head. All money received from the State treasury, without regard to the name of the fund, should be reported together, for in no two States are the funds distributed in the same way, and no other arrangement than this is practicable when cities of all States are brought together in the same statistical table. The same may also apply to "city appropriations," general appropriations, special appropriations, appropriations for superintendent's salary—all should be included. County school taxes are imposed in some States, and receipts from this source should have a separate place in the financial statements of cities benefited by such taxes. Tuition fees received from non-residents form an important part of the income of some school-boards, and for this reason, as well as to show the extent of outside patronage, this subdivision is useful.

"The total receipts for the year" do not include money borrowed either by negotiating simple loans or by the sale of bonds. As this total may be used in summing up the receipts for a number of years, it will be seen that to include receipts of money borrowed would necessarily lead to duplication and the apparent receipt of more money than was really available for school purposes, for the receipts of a future year will include the funds for the payment of the loans. The balance remaining from the previous year was a part of the receipts of that year, and must not be included in this. "The total amount of funds available during the year" includes both the balance from the previous year and the receipts from loans and bond sales, and must not, therefore, be used to determine the receipts for a series of years.

Expenditures of school moneys.—School expenses are of three kinds: First, permanent expenditures; second, expenses for supervision and teaching; third, current or incidental expenses. These terms are generally understood and need little explanation. There is some likelihood of error, however, in regard to what should be classed under "permanent repairs." Nothing should be included under this head that does not add to the permanent value of the school property. Minor repairs that merely replace loss or restore the buildings to their previous good condition should be considered as current expenses. "The total expenditure for schools" does not include the payment of the principal of loans and bonds, for this expense had already been included in previous totals, and to include the payment of indebtedness incurred by such expenses would only lead to duplication.

It may be well to call the attention of reporting officers to a mistake that is not infrequently noticed, namely, failure to report items of school expense not paid directly by the school treasurer. In certain cities the board of education controls only a portion of the money expended for schools. In some localities the superintendent of schools is considered a city officer, and his salary is paid without passing through the hands of the board of education; in others, janitors of school buildings are neither controlled nor paid by the school authorities; in yet others, all expense for building, repairs, and the like, is met by the city council directly, such expense not appearing on the books of the school board. In reporting school expenditures, all these items should be included, whether paid by the school-board or not. The mere fact that the money was not disbursed by a school officer makes the expense no less a school expense. There is only one way to report school finances so that all cities may be fairly represented upon the same basis, and that is to report all expenses incurred in the maintenance of the schools.

High schools.—The terms used in the high school table are either self-explanatory or have been explained in the preceding paragraphs. The number of students, instructors, etc., shown in that table are not additional to the general statistics, but are included therein.

¹ President of board of education.² Secretary of board of education.³ Principal.⁴ School commissioner.⁵ Principal of public schools.⁶ Clerk of board of education.⁷ County superintendent.⁸ Principal of schools.⁹ Secretary of school board.

*Names of City Superintendents by whom the Information in Tables 20, 21, 22, 23, and 24 was
Furnished—Continued.*

PENNSYLVANIA—continued.

Philadelphia, Jas. MacAlister.
Phoenixville, H. F. Leister.
Pittsburg, Geo. J. Luckey.
Pittston, Robert Shiel.
Plymouth, P. Martin.¹
Pottstown, W. W. Rupert.
Reading, Z. X. Snyder.
Scranton, George W. Phillips.
Sharpsburg, W. T. Noss.
Shenandoah, L. A. Freeman.
South Bethlehem, Owen R. Wilt.
South Easton, S. E. Shull.
Susquehanna, Jas. F. Lannon.²
Tamaqua, Robt. F. Ditchburn.
Titusville, R. M. Streeter.
Tyrone, B. F. Pinkerton.
Warren, A. B. Miller.
Washington, A. G. Braden.
Westchester, S. W. Starkweather.
Wilkes Barre, A. W. Potter.³
Williamsport, S. Transeau.
York, W. H. Shelley.

RHODE ISLAND.

Bristol, J. P. Reynolds.
Burrillville, Rev. A. H. Granger.
Central Falls, Asa H. Nickerson, M. D.
Cranston, Aaron S. Haven.
Cumberland, Robert Murray, Jr.
East Providence, George N. Bliss.
Johnston, W. E. Wilson.
Newport, Geo. A. Littlefield.
Pawtucket, Fred. Sherman.
Providence, H. S. Tarbell.
South Kingstown, Arthur W. Brown.
Westerly, Rev. O. U. Whitford.
Woonsocket, Frank E. McFee.

SOUTH CAROLINA.

Charleston, Henry P. Archer.
Columbia, D. B. Johnson.
Greenville, Wm. S. Morrison.

TENNESSEE.

Chattanooga, H. D. Wyatt.
Clarksville, J. W. Graham.
Jackson, Frank M. Smith.
Knoxville, Albert Ruth.
Memphis, C. H. Collier.
Union City, Price Thomas.

TEXAS.

Austin, John B. Winn.
Brenham, W. H. Flynn.
Brownsville, J. F. Cummings.
Denison, W. D. Gerard.
El Paso, C. Esterly.
Fort Worth, Alex. Hogg.
Galveston, Jacob Bickler.
Houston, W. S. Sutton.
Palestine, J. E. Rodgers.
Paris, C. A. Bryant.
Sherman, Nathan Somerville.
Waco, J. N. Gallagher.

UTAH.

Ogden, Edw'd H. Anderson.⁴
Provo, ———.

VERMONT.

Bennington, Ralph H. Bowles, Jr.
Brattleboro, Albert D. Spaulding.
Rockingham, Geo. A. Brown.
Rutland, Edward L. Temple.
St. Johnsbury, Anne S. May.

VIRGINIA.

Alexandria, Richard L. Carne.
Fredericksburg, E. M. Crutchfield.
Lynchburg, E. C. Glass.
Norfolk, Geo. W. Taylor.
Petersburg, D. M. Brown.
Richmond, Jno. B. Cary.
Staunton, W. W. Robertson.
Winchester, Maurice M. Lynch.

WASHINGTON.

Tacoma, E. P. Young.
Walla Walla, R. C. Kerr.

WEST VIRGINIA.

Charleston, Richard Gaill.
Grafton, U. S. Fleming.
Martinsburg, J. A. Cox.
Parkersburg, W. M. Straus.
Wheeling, W. H. Anderson.

WISCONSIN.

Appleton, A. B. Whitman.
Baraboo, W. J. Brier.
Beloit, T. A. Smith.
Berlin, N. M. Dodson.
Chippewa Falls, C. R. Long.
Fond du Lac, I. N. Mitchell.
Fort Howard, Otis E. Larsen.
Green Bay, Cornelia B. Field.
Janesville, C. H. Keyes.
Kenosha, James Cavanagh.
La Crosse, Albert Hardy.
Madison, Wm. H. Beach.
Menomonee, Stella Lucas.
Merrill, Howard A. Talbot.
Milwaukee, Wm. E. Anderson.
Monroe, C. F. Niles.
Necnah, Robt. Shiells.
Oconto, D. P. Moriarty.
Oshkosh, W. A. Gordon.
Portage, Chas. T. Susan.
Racine, H. G. Winslow.
Sheboygan, Geo. Heller.
Stevens' Point, Frank W. Cooley.
Watertown, C. F. Diebalin.
Waukesha, Geo. H. Reed.¹
Wausau, Chas. V. Bardeen.

WYOMING.

Cheyenne, J. O. Churchill.

¹Principal.

²Secretary of school board.

³Superintendent of third district.

⁴County superintendent.

TABLE 20. — Statistics for 1887-88 of Population and School Enrolment and Attendance in Cities and Towns Containing over 4,000 Inhabitants.

* Statistics of 1886-87.

a Includes repairs, fuel, and contingent expenses.

b Includes also expenditures for text-books.

c Salary of superintendent (\$600) paid from general fund of city.

d Paid from general fund of the city.

e Includes \$2,400 paid from the general fund of the city to the secretary of the board of education.

f \$5,000 transferred to "revolving fund."

g Included in current expenses.

h Includes rent and insurance.

i Includes "incidentals."

j Does not include permanent expenditures.

k Not paid from school fund.

*Statistics of 1886-87.

a Balance transferred to other departments.

b Expenditures for school books included in Column 4.

c Not under control of school committee.

d Covered into town treasury.

e \$23 expended in excess of appropriations.

f Owing to a change in the fiscal year, this statement covers the period between March 13, 1887, and September 1, 1888.

TABLE 23.—Statistics for 1887-88 of Expenditures of Public School Systems of Cities and Towns containing over 4,000 Inhabitants—Continued.

Expenditures of School Moneys.																		
City or Town.	Permanent.					Tuition.				Incidental.						Total Expenditure for Schools.	Paid on Bonded Indebted- ness.	18
	Sites and Build- ings.	Furniture.	Libraries and Apparatus.	Permanent Re- pairs.	Total Permanent.	Salaries of Super- intendents, etc.	Salaries of Teach- ers.	Total Tuition.	Officers of School Boards, Clerks, Messengers, etc.	Fuel and Lights.	School Books Supplied for Use of Pupils.	Interest on In- debtedness.	All other Current Expenses.	Total Incidental.

* Statistics of 1886-87.

a Includes all permanent expenses.

b Account overdrawn.

c Account overdrawn \$416.

d Included in Column 14.

e Includes principal of indebtedness also.

f Deficit, \$1,906.

g The items amount to \$11,763; they include the pay-

ment of orders amounting to \$1,183 outstanding

from previous years.

h Expenses for light and fuel included in Column 14.

i Deficit, \$390.

j Deficit, \$41.

TABLE 23.—Statistics for 1887-88 of Expenditures of Public School Systems of Cities and Towns containing over 4,000 Inhabitants—Continued.

Expenditures of School Moneys.																	
City or Town.	Permanent.				Tuition.				Incidental.						Total Expenditure for Schools.	Paid on Bonded Indebtedness.	Amount Carried Forward to Next Year.
	Sites and Buildings.	Furniture.	Libraries and Apparatus.	Permanent Repairs.	Total Permanent.	Salaries of Superintendents, etc.	Salaries of Teachers.	Total Tuition. * Statistics of 1886-87.

a High school merged into State normal school.

b The schools of the system are designated as primary schools and high schools.

c Advanced pupils go to Troy or Albany.

e The course of study covers nine years, three of which are devoted to the "high school department."

d The public school system of New York City really includes the College of the City of New York, for boys, and the Normal College, for girls, but they are not under the control of the board of education as such. Each of these institutions is under the jurisdiction of a board of trustees consisting of the members of the board of education and the president of the college. Statistics relating to them may be found in Tables 49 and 52 respectively.

NORTH CAROLINA.

α Statistics of 1886-87 used in the tables.

THE TABLE OF COMPARATIVE STATISTICS OF ENROLMENT, ATTENDANCE, ETC.

The ratios and averages presented in this Table reveal facts which would be apt to escape attention in an examination of the usual tables of absolute statistics. In every column are many ratios that immediately arrest the attention because of their astonishing superiority over those of other cities in which the popular interest in education is supposed to be greater. While some of these startling differences may be explained by the assumption that the unusually large percentages are due to the existence of errors, it is not always safe to dismiss their consideration upon such grounds. A careful examination of this Table, and that following next but one, will show that more than one school system bear reputations for excellence based less upon results actually accomplished than upon the high esteem in which the abilities of the principal officers of such systems are held by the members of the profession generally; and that many cities whose schools have scarcely received respectful consideration in the pedagogical world have more reason to boast of their educational achievements than have some of the supposed leaders in popular education.

Ratio of total public and private school enrolment to population six to fourteen.—Without venturing an explanation, and without the expression of an opinion as to the accuracy of the statements from which the ratios were made, attention is called to the fact that in Union City, Ind.; Flint, Mich.; Wooster, Ohio; Braddock, Pa.; Austin, Tex.; Tacoma and Walla Walla, Wash., the total enrolment in public and private schools is twice as large (over two hundred per cent.) as the population six to fourteen. In all these places the population four to twenty-one is much less than the reported enrolment. A considerable number of other cities show total enrolments abnormally large when compared to their population, but in no other than those mentioned is the percentage greater than two hundred.

As to the inferences to be drawn from these ratios, it must first be said that if entirely correct they show that the schools of those cities are of such marvellous efficiency and attractiveness as to draw into them not only the entire minor population over four years old, but many others, either from other localities or from the adult inhabitants. Among the disturbing elements that sometimes lead to discrepancies in the returns of these items may be mentioned the presence of institutions of superior grade whose students are erroneously included in "the number of pupils in private and parochial schools;" failure to exclude duplicate enrolments; an imperfect and carelessly taken school census.

Ratio of public school enrolment to population six to fourteen.—Those cities in which the enrolment in public schools exceeds the population six to fourteen have done praiseworthy educational work. Those in which the public school enrolment is greater by fifty per cent. than the population six to fourteen should receive especial consideration at the hands of school officers of other cities. The methods by which they secure an object so greatly to be desired should be made known to all, that they might be widely copied—provided the flattering showing is not the result of a very defective census. The following are the cities in which the percentage of public school enrolment to population six to fourteen exceeds one hundred and fifty: Aspen, Colo.; Atlantic, Boone, Oskaloosa, and Ottumwa, Iowa; Hutchinson and Independence, Kans.; Calais, Me.; Framingham, Northbridge, and West Springfield, Mass.; Coldwater, Flint, Ludington, Pontiac, and West Bay City, Mich.; Duluth, Minn.; Corning, Hoosick Falls, Ilion, Medina, and Saratoga Springs, N. Y.; Braddock, Honesdale, and Milton, Pa.; Tacoma and Walla Walla, Wash.; Baraboo and Monroe, Wis.

Ratio of private school enrolment to total public and private school enrolment.—In thirty-nine cities and towns there are no private or parochial schools. It is to the credit of the public schools in these places that their accommodations and instruction are such that no private establishments can exist in their vicinity; but it will be observed that with three exceptions, viz., New London, Conn., Auburn, Me., and Medford, Mass., all are cities and towns of the sixth or the smallest class admitted to these tables. Private schools are not without a certain value, and it is not reasonable to hope that they will be entirely displaced, especially in the larger cities. It is not a favorable indication, however, to observe an undue proportion of the children enrolled in schools of a private character. In fifty-four cities the private school enrolment amounts to more than one-third (33.3 per cent.) of the total public and private school enrolment.

Ratio of average daily attendance to population six to fourteen.—The ratio of average daily attendance to the population six to fourteen for the United States is 65.8 per cent. In eighty-two cities this percentage is over one hundred. In other words, the average daily attendance in the public schools is greater than the population six to fourteen. A great many of these cities are in States in which the school fund is divided upon the basis of school population, and it is presumable that in them the census is at least fairly complete. In the matter of public school attendance, therefore, the eighty-two cities mentioned deserve especial praise.

Ratio of average attendance to enrolment.—It will be seen that the ratio of average attendance to total public school enrolment is usually between 65 per cent. and 75 per cent. Noteworthy regularity on the part of those enrolled is indicated by an average attendance that approaches or exceeds three-fourths (75 per cent.) of the total enrolment. The percentages that mount high in the nineties, however, may be looked upon with suspicion. The items from which they were calculated were in all probability not obtained by the methods described at the beginning of this chapter. In twenty-seven cities the average number of days which each enrolled pupil attended school during the year was less than one hundred, and in four cities the average was less than eighty days or four school months. On the other hand, the average exceeds one hundred and sixty days, or eight school months, in forty-six cities.

Column 8 offers a favorable opportunity for comparing the public school work done in the several cities. All are placed upon the same basis. The "total attendance in days" shows the whole amount of instruction imparted, and the quotient obtained by dividing this quantity by the population six to fourteen represents the proportion of the attendance to the population of the usual age for school attendance.

The average number of pupils in attendance to each teacher is a widely varying quantity. In Saco, Me., the average is 12; in New Milford, Conn., 20.3; in Talladega, Ala., 21.1. In Mobile, Ala., the number is 60; in Jackson, Tenn., 61.2; in Jackson, Miss., 91.7; and in Stevens' Point, Wis., it is no less than 92.6. All these instances are exceptional, however, as it will be seen that in but few cases is the average less than 30 or more than 50.

Proportion of male teachers.—The smallest proportion of male teachers reported by any large city is that at Wilmington, Del., where there is but one male in a force of one hundred and sixty-four teachers. Fourteen of the smaller cities employ only female teachers.

Accommodations.—The relative sufficiency of accommodations, so far as quantity is concerned, is shown by Columns 10 and 11, though no ratio which it is practicable to use in these tables can show whether any city provides all the accommodations needed for the proper prosecution of its school work. The average seating capacity of buildings is shown by Column 13.

High schools.—The only universally recognized division of the common school course of study is that into high and elementary schools. It would be interesting and profitable to know what proportion of the whole number of pupils are enrolled in the different grades of schools, but the differences in organization are such that it is possible only to show the proportion that reach the high school.

As would naturally be supposed, the attendance of pupils enrolled in high schools is much more regular than the attendance of the younger pupils in almost every city represented in the Table; but it will probably be surprising to many high school teachers of long experience to note so many percentages over 95, and to observe that in one case (Auburn, Me.) the average attendance is 98.8 per cent. of the total enrolment for the year.

Comparison with summarized statistics.—The value of this Table will be greatly enhanced by frequent reference to and comparison with similar ratios in the Table of summaries (Table 26). Intelligent comparison with statistics of other systems and with the summarized statistics of States, divisions, and classes can not fail to be profitable.

THE TABLE OF COMPARATIVE STATISTICS OF SCHOOL PROPERTY, TUITION, EXPENSES, AND RECEIPTS FROM SCHOOL TAXES.

The one great ambition that seems to control a great many of those to whose care the finances of schools are confided is to conduct those schools at the smallest possible cost. Another class—a small one, unfortunately—take pride in pointing to large appropriations as the best possible evidence of enthusiasm in school work, and boast of liberality if it appears that their schools are more expensive than those of other cities. There are, therefore, two entirely opposite standards of excellence in the matter of school finances, and the individual investigator must judge the cities whose accounts are here presented in accordance with his own ideas of the duty of the city in regard to the education of its children.

The total assessed value of property per capita of population six to fourteen is valuable mainly for its power to show the wealth of a city and the extent of its ability to support public institutions. In some cases State laws prevent liberal appropriations, and in exceptional instances other circumstances make liberality to the schools impossible, but these things are causes which it does not come within the domain of statistical tables to show. The facts only are presented; the causes for the facts must be found elsewhere. It may be well to again state in this connection that different bases of assessment greatly detract from the value of this item in comparing cities of different States.

Per capita and proportional value of school property.—In considering the matter of school property it is essential that not only the per capita value but also the proportional value be taken into consideration. It is well known that property values do not depend on the size of the city. Two cities containing precisely the same number of school children and offering exactly similar accommodations may have secured the latter at widely different prices, due to the greater value of property in one than in the other. But the greater the property value, the greater will be the ability of the city to pay the increased prices for the property needed, for tax receipts increase with property values. It does not necessarily follow, therefore, that differences, especially slight differences, in the per capita values of school property indicate different degrees of sufficiency. Nor is the proportional value alone a safe criterion, for the total valuation of property offers in itself no reliable clue to the number of school children to be provided for. It is only by taking both the per capita and proportional values (Columns 3, 4, and 5) into consideration that just conclusions can be reached.

The cost of supervision and teaching is the most reliable as well as the most important of the items of expense shown by these tables, and with a few exceptions comparisons based upon it may be made with confidence in its accuracy. Column 6 shows that the cities that pay most to teachers and supervising officers per capita of population six to fourteen are Aspen, Colo. (\$25.23); East St. Louis, Ill. (\$20.34); Oskaloosa, Iowa (\$20.63); Arlington, Mass. (\$25.87); Boston, Mass. (\$21.08); Dedham, Mass. (\$23.42); Fitchburg, Mass. (\$21.04); Hingham, Mass. (\$22.74); Medford, Mass. (\$20.70); New Bedford, Mass. (\$23.80); Waltham, Mass. (\$20.93); Watertown, Mass. (\$20.60); Winchester, Mass. (\$20.40); Duluth, Minn. (\$22.63).

The cities that pay least per capita of population six to fourteen are Eufaula, Ala. (\$1.46); Lively, Ala. (\$1.16); Augusta, Ga. (\$2.85); New Orleans, La. (\$3.53); Jackson, Miss. (\$3.14); Washington, Mo. (\$3.26); Fayetteville, N. C. (\$3.43); Oconto, Wis. (\$2.25).

The most expensive systems per capita of average attendance so far as this item is concerned are those of Tucson, Ariz. (\$30.74); San Francisco, Cal. (\$25.76); Pueblo, Colo. (\$27.86); Norwich, Conn. (\$25.73); St. Paul, Minn. (\$27.76); El Paso, Tex. (\$26.65); Cheyenne, Wyo. (\$23.59).

The smallest amount per capita of average attendance is paid to the officers and teachers of Eufaula, Ala. (\$5.26); Lively, Ala. (\$4.90); Key West, Fla. (\$6.61); Calais, Me. (\$6.20); Eastport, Me. (\$6.69); Jackson, Miss. (\$3.55); De Soto, Mo. (\$5.52); Greenville, S. C. (\$6.97); Grafton, W. Va. (\$6.23); Martinsburg, W. Va. (\$6.34); Oconto, Wis. (\$2.54).

The amount received from city or town taxes is not a just basis for comparison except between cities and towns of the same State. In certain States the State school tax is quite heavy, while in others the schools are almost entirely supported by local taxation. As the income from the State apportionment increases, the necessity for purely local taxation decreases; and since in case of State taxes the cities usually contribute more than they receive, it is not fair to place upon the same basis amounts raised by city taxes in the States in which large State appropriations are the rule, and the amounts raised by those cities which appropriate their school moneys direct without the medium of the State treasury.

CHAPTER IX.

THE TRAINING OF TEACHERS.

Professional schools educate but a minority of the teaching body—Impossibility of obtaining statistics and information as to the character of "institute" instruction—An examination of the proceedings of teachers' meetings instituted, for expressions of opinion on the condition of the teaching body—The characteristics of such associations—Their value—Problems of the year—Chairs of pedagogy—Normal schools—Institutes—The Illinois institute syllabus—Local supervision of teachers—The College for the Training of Teachers in New York City—The Peabody Normal College—Proposed national normal college—Physical and manual training—What and how normal schools teach—The Peabody Fund—The meagre salary excludes the professionally trained teachers from the country school—The State normal schools do not supply the demand in cities—Do the graduates teach?—Not improbable that the annual demand for beginners is about equal to the number teaching who have attended a normal school—Attendance at public normal schools for 1887-88—Graduates—Permanent funds—Tuition—Average annual cost of board and lodging—Receipts—Statistics of private normal schools—Kindergarten training schools—Condition of normal schools and the work of other instrumentalities for qualifying teachers with extracts from the proceedings of their annual meetings for 1887-88, by States—Statistics of individual public normal schools, Table 32—Of individual private normal school, Table 33—Of individual schools for training kindergarten teachers, Table 34.

AN EXAMINATION OF NORMAL SCHOOL WORK NOT SUFFICIENT.

It is well known that the annual catalogue of institutions of every kind is not, in the great majority of cases, a record of the events of the year. It is not intended to be such; its purpose is avowedly to give information concerning the school as a place where education may be obtained, not to chronicle the vicissitudes of the year. It will therefore be seen that it is not from such a source that information as to the condition of the profession of teaching is to be found; nor would such information, if found there, be complete. An examination of the following pages will show that normal schools furnish but a small proportion of the teachers of the public schools; the vast majority have never received professional training. To educate this majority a peculiar and American institution has been established called an institute. In this, at annual intervals, the teachers of the county or "institute district" are assembled for periods varying from one week to four or more, and receive instruction of uncertain kinds at the expense of the State, the county, or, in some cases, in part at their own expense.

The activity of these two agencies for the professional training of the teacher and the intending teacher, and the results, might give some idea of the quality of the teaching in the schools were it possible to gauge the exact value of institute instruction given to adult pupils for one or more weeks in a manner varying with the locality and to a number which may be all, many, or a few of the teachers of the district embraced. Such statistics are as yet impossibilities as far as this Office is concerned.

But there is a third institution for the training, at least cultivation, of teachers that we have heretofore neglected, and this is the teachers' association. Not that it is to be assumed that all the teachers of the State or county belong to these annually convened assemblies; far, unfortunately, from that. But because in following their discussions we may get at least some idea of the condition of the educational affairs of the State. There is another advantage that is to be considered; the proceedings of these meetings are for the most part printed in the school journals, and we are thus relieved from the necessity of awaiting the publication of reports, which so long delays our own.

In the last report of this Office the presentation from the catalogue point of view was exhaustive, the normal school and its course of study were defined, and the origin and methods of the institute given. We will, therefore, assume that the reader knows that as one turns from contemplating one of these schools to another, a never-changing view is presented, kaleidoscopic in all save symmetry, and that institutes shade down from professional through elementary instruction until they degenerate into a parliamentary assembly; and, in view of this assumption, will proceed directly to considering the events of the year, first, however, making a few remarks on the varieties of the associations formed by those engaged in the profession of teaching.

TEACHERS' ASSOCIATIONS.

Even undertakers have an association, says Superintendent Palmer, of Alabama; why not the teachers? The idea is not new, and the many pedagogical associations of Germany have been thought by some to have been a great influence in forming the pedagogical part of that most pedagogical nation, where, as Grimm says; teachers are as common as monks in Spain or Italy. Alumni associations are formed primarily on memories of the past not unconnected perhaps with anticipations of more material pleasures annually, and joint-stock companies for the purpose of material profit; but the association of teachers is founded on a desire for professional improvement and is a matter of pecuniary loss; how great, we are unable to say. The editor of the Iowa School Journal computes that the expense to the teachers of attending the 96 Iowa institutes of the year in that State would be \$200,000 including instruction and examination fees.

These associations meet annually with but few exceptions, and it is inevitable that, unless avoided by the most capable management, the proceedings of meetings held at such comparatively frequent intervals should become monotonous, or there is danger that, in the effort to avoid common-place, the speakers may consult their imagination for the ideal rather than the common experience of themselves and their hearers, in an effort to assist them to "kick against the adamant of things," as Carlyle characteristically says.

That dullness or fancy does not necessarily preside at these gatherings, the paper by the California professor, given under that State, will show, and any one reading his glowing tribute to the country teacher—where the battle for education is being fought as that for manual training is being fought for in cities—will fully acquit him of a tendency to be unsympathetic; while the address of the president of the superintendents' section of the Ohio association shows that it is as valuable to collate opinions as to add another to the many on the list, and the warm language of the president of that association—so warm indeed that we stopped where he really began—that it is not necessary to be dull.

To give definiteness and force to the expression of opinion on matters of moment, committees are formed in some associations to which are referred the topics upon which it is necessary to have a formal expression of view. In some cases the committees report during the same meeting, in others at the following one.

But the tendency to specialization is, in all likelihood, the most potent force in association work. When it has produced an association of persons following the same profession it immediately begins to group the members, and superintendents' sections, primary sections, and college sections are the results. Even the Michigan association, if our authority be right, where what is good for one is deemed good for all, has yielded so far as to organize a primary teachers' department. Nor is this wheel-within-a-wheel system apparently altogether satisfactory, for we find that superintendents' associations, city and county, are quite common, while the teachers, turning from the smooth Latin-English word association, denominate themselves a "club" or a "round table." This change of name very likely denotes something more than the desire for variety of nomenclature. The meeting of the club at least may have something of the alumni dinner in it, while the round-table gathering exchanges the rostrum for the easy-chair.

The direction of its educational affairs is entirely in the hands of the State, its power pervading its territory to the imaginary lines or natural features by which it is defined. But the teachers of the States have not found these impassable. Seven degrees forty minutes west longitude from Washington does not avail to keep the city superintendents of Indiana from meeting those of Ohio when they have a mind to, and the headwaters of the Potomac have been ineffectual to prevent the West Virginia association from meeting in joint convention with the Maryland organization, which meeting was so satisfactory that the two associations appointed a committee of five to attend the meeting of the associations of Pennsylvania and of Kentucky and to invite those associations to return the compliment.

Not only is a community of professional thought and feeling uniting the teachers of the central States of the East, but a spirit of human sympathy has caused the teachers of Baltimore to organize a "Beneficial Association" with the object of mitigating the evils that are apt to overtake the recipient of a comparatively small salary when ill, and, in case of death, to pay a sum of money to those he leaves behind. A similar association in New York City goes even farther; members who retire after having taught for thirty-five years, in the case of women, and forty years in the case of men, receiving aid from a fund composed of one-half of all receipts. The State superintendent of California calls for a pension for teachers, and the teachers of Alabama are providing a "home" which would appear to be, however, a place to recuperate at rather than to retire to.¹

¹ There is a similar society in Texas, but we are obliged to postpone an account of it until our next Report owing to the late day at which the information came to hand.

Before leaving the subject of providing for the future of the teacher who has spent his life in his profession we shall give some statistics from the last report of the State superintendent of New Jersey. Of 3,919 teachers of whom a record was obtained, 565 had taught between 10 and 15 years, 339 between 15 and 20, 142 between 20 and 25, and 118 over 25 years.

As to the value of association to teachers, of hearing discussions, should any one doubt either as factors of improvement, after acknowledging the status and power that otherwise humble individuals as a body possess, let him consider their value as a corrective of conceit arising from mental isolation, the "*intellectus sibi permissus*," as Bacon calls it in a somewhat different connection, and in addition the following inquiry from John Stuart Mill: "What does any one's personal knowledge of Things amount to, after subtracting all which he has acquired by means of the words of other people?"

REVIEW OF THE DISCUSSIONS OF THE YEAR.

It is evident that the American educational world has been agitated during the year by the question of providing for the improvement of the country school, manual training for the city school, better supervision, better curriculums, and better teachers; the last, above all, since it is only through the teacher that all directly is done. Whether in the last analysis the pittance paid to the country school teacher is the cause of the unsatisfactory condition of country schools, is a problem of political economy, and whether manual training is the result of poor teaching rather than the inevitable results of intrinsically poor methods, is a problem of pedagogy, and to the learned in these sciences we leave both. The manual training movement, as such, however, is fully treated in another chapter.

The question of better teaching embraces, of course, all the tentatives toward answering it, and among these we will include local supervisors, and this includes their manner of appointment. What is said is particularly applicable to the rural school where the demand is greatest, the city school having run through the gamut of improvement on the old line and is now seeking to improve along a new. More than one-half of the schools of Pennsylvania are yet ungraded country schools.

CHAIRS OF PEDAGOGY.

First in order among the demands for providing for the professional training of teachers, though not the most important, is a chair of pedagogy in the State University. This is what is sometimes meant by "a more intimate connection between the public schools and the higher institutions." These are urged by Professor McGrew, himself a professor of the science and art of education at the University of the Pacific, as being of inestimable value to the public schools; by Professor Heston, of the State College of Pennsylvania, as best answering the question, "What can the university do for the common school, since they would graduate competent superintendents and normal school professors;" and by Professor James, of the University of Pennsylvania, as supplying teachers for "our higher schools and college." As Mr. James is speaking of the academic class of teachers with whom we are less familiar we will give the reasons which cause him to think teachers so trained to be needed in such institutions.

"There is a great need of such training, as is evidenced by the fact that the average teaching in such schools is far below what it might be and should be in point of efficiency. As a class the actual teachers in our schools [high schools and colleges] are to a large extent men and women, who are looking forward to entering some other occupation as soon as practicable, and are devoting their whole time to preparation for such work. * * * It is evident that the work of such a class as this can not be of a very high character when tried by any fair test of efficiency. It is also evident from any close examination of the work actually done. Any director or head-master will tell you in close confidence that it is very easy to get teachers, but very difficult to get good teachers." That it is possible to remedy this by special college or university courses, Mr. James thinks is proven by the experience of Germany.

NORMAL SCHOOLS.

But it seems to be admitted that it is not feasible, at least not probable, that all teachers will be professionally educated at a college. The rank and file must be trained in the normal schools, which the president of the recently founded New York college thinks are not professional schools at all in the sense that a school of medicine, or law, or theology is a professional school.

In all cities not having a school of this kind there is loud demand for a school or training class, "an indispensable adjunct to a good school system," says the superintendent of Baltimore. We have given an account of the growth of one of these on page 425 under Massachusetts.

The environment of the city normal school is such as to afford every opportunity for empirical proficiency, and as it is quite usual to draw its members from the graduates of the high school, practical experience, maturity in years, and an academic foundation are insured. It will be observed that the principal of the Philadelphia school protests against the admission of those who are comparatively children (p. 444).

But the case with the "normal school" as a State or isolated institution is somewhat different. "Medical schools teach medicine; law schools teach law; theological schools, theology; what do or rather what don't normal schools teach," inquires the eminent president of one of them whose valuable article we have depended so much upon as relieving us from treating the subject at length.¹ In fact it is most decidedly evident that men engaged in the profession, first defining professional instruction in a concrete way, by instancing that given in a school of medicine, law, or theology, are demanding that normal schools give professional instruction too.

In California, in Minnesota, and in Wisconsin, a system of normal schools obtains; but founded under less advantageous circumstances, the schools of New York and Pennsylvania are not so completely a part of the State system. The State superintendent of New Hampshire describes the change of the school of that State from an academy with a normal class attached to a normal school (p. 433), but from what Superintendent Draper says the academic features of the schools of New York can not be honorably removed unless a "new contract or bargain" be made with the locality in which each is situated.

In leaving this class of schools we will call the reader's attention to the abstract of the proceedings of the normal department of the National Educational Association at Chicago, to the remarks of the president of the New York College for Teachers, and to the remarks under the several States, especially to Superintendent Draper's statement that "normal work of a lower grade and less in extent must be had to supply the wants of the rural schools," which, to use the sarcastic language of a superintendent of Pennsylvania, "doctors of pedagogy" neglect, and distinguished visitors foreign and domestic are never taken to see.

TEACHERS' INSTITUTES.

But important as they are normal schools have not been nearly so much discussed during the year as institutes, the means of educating the teacher whose qualifications are for the most part, we believe, that he has passed an examination on the matters he has been taught and is to teach. In medicine those who practice without a knowledge of anatomy are called quacks, and to prevent possible quackery is the fundamental purpose of the institute; it is to train as teachers those who are teachers by reason of their knowledge of the elements of learning, and not from their ability to impart them.

The effort to give the institute a character that will enable it to accomplish its object is most determined. Under the heads institutes and teachers' meetings, in the accounts of the condition of the teaching body in the States of California, Illinois, Indiana, New Hampshire, New York, Ohio, Pennsylvania, Virginia, and Wisconsin, will be found remarks more or less extended relating to this matter.

It is evident that the inherent defect of this class of schools is the short duration of session. One can not examine a science in forty-five minutes any more than one can learn to use a language in a half dozen weeks, as is fatuously promised now and then; and we find both Professor McGrew and Superintendent Draper striving to remove this objectionable feature. Mr. McGrew proposes, and his proposition seemingly met with the approval of the teachers of the State, that the institute be a professional school with a session of four weeks and a continuous course of study running through three or four years. Mr. Draper, *facile princeps* in efforts to improve the teaching body, announces that it is the intention to arrange a course of institute work "which shall be continuous from year to year and year after year for three or four years," thus obviating annual repetition and chance.

This bold and comprehensive plan can not be too much admired. It has all the virtues that the graded course has over the ungraded, with the additional value that the ever-vivifying and reimpresing incidents of the school-room will help the teacher to digest the professional diet of the institute. But it is clear that if the course is of three or of four years there must be three or four concurrent classes of different grades; how these are to be provided for the gentlemen do not say, or even in fact mention them.

During the discussion of the county teachers' institute at the forty-third annual convention of the Ohio association, Superintendent White said that he would make no compromise with that class of teachers who demand that the institute shall be a means of preparing them for getting a teacher's certificate. Indeed, it is evident that the institute is being looked upon as a "professional school." But as such it must have a course of study. The facility with which a warm imagination can outline a scheme of work, the embarrassment of a practical, though logical, mind in arranging its details and the

difficulties the firmest will has in overcoming impediments to its operation, are nowhere better shown than in the inception, completion, and execution of the plan of study called a programme.

One of the earliest, if not the first programme for an institute was prepared by the State board of education of Indiana in 1881. In 1883, there being a demand for "another outline," the State superintendent appointed a committee composed of five county superintendents to prepare, under his direction, the plan of county institute work for that year. So manifest was the value of the programme when tested in the institutes of Indiana that Superintendent Holcombe was also authorized to appoint a similar committee to assist him in preparing an outline of work for the township institutes of the State. The programme, or "Township Outline," thus inaugurated has become "a leading factor in educational progress;" but before examining it as prepared for the forthcoming year, it is advisable to briefly note the character of the early programme for county institute work.

This had the form of a programme of a school. There were five days of work, each beginning at 9 in the morning and closing at 4 in the evening, with an interval of an hour and a half at noon. In a school, however, the whole of first day is consumed in organization; in these institutes one hour was considered sufficient for the purpose. Forty minutes of each day was devoted to the "Science of Teaching." The subject-matter of this topic was distributed under five heads, as follows:

1. *The school defined.*—Its purpose is to prepare for independent activity in the other institutions of society; its method of accomplishing its purpose is by training the will, by inculcating habits of observation and reflection, and by imparting scientific knowledge of practical value.

2. *Conditions of the school.*—The hygienic conditions without and within the school, the physical and mental conditions of the teacher and pupils as related to school work.

3. *Mental processes employed in learning.*—Discrimination, its conditions, cessation from mental labor, products of exercising the faculty. Remembering, its pedagogical importance, conditions and laws, is founded on attention. Seeing arguments, the faculty of noting similar elements in different things; that is, of forming general or abstract ideas, the basis of classification. Construction, the faculty of reproducing that which has been separated into its elements. These four are the chief processes employed in primary instruction.

4. *The order of dependence of the mental faculty involved in learning.*—Knowledge is acquired only as the memory can reproduce it; memory is dependent on concentration of the attention, and this concentration on the activity of the will, and finally the will acts in obedience to motives. "The chapter which treats of motives is one of the most important in educational psychology."

5. *Motives proper to be employed, and powerful in influencing the will.*—Motives of sense, of self, arising from our relations to others, arising from the studies of the different branches of knowledge.

The other topics of instruction at the county institutes related to the manner of giving instruction in the common school branches. We now turn to the programme of the Indiana township institutes.

"At least one Saturday in each month during which the public schools may be in progress shall be devoted to township institutes or model schools for the improvement of the teachers," recites the Indiana law on this subject. "More than four thousand of these institutes have been held during the year," says Superintendent Smart in one of his reports. The importance of these meetings is at once apparent, and their proper management becomes a matter of moment, a matter, in fact, inferior to no other educational agency in the State. In another place we have spoken of the Indiana Reading Circle and its course of study; and it is only needful to state in this connection that the necessity of making the reading circle work an integral part of that of the institute, so obvious to the promoters of circles in other States, has for some time been acknowledged and acted upon in this.

"The Township Institute," says the chairman of the committee preparing the last outline, "is a leading factor in educational progress. Its design and purpose no longer need explanation. The life of a system of schools is dependent upon the *life and growth* of its teachers. When teachers cease to grow, the schools begin to decay. The Township Institute may be made a most valuable means of growth. The chief object of an institute should be professional culture and training; its greatest aim, to impart a knowledge of the principles and methods of teaching and school management. These topics (of the 'Outline') have been selected and arranged with this view, as well as the general culture and education of the teachers and others who attend them. * * * It is recommended that not more than six topics—four besides the Reading Circle work—be selected and arranged for discussion in any one day. Each exercise should be presented by the person to whom it has been previously assigned, and conclude with a general discussion, opened by an appointed leader."

It is evident from an examination of the printed Outline that the township institute of Indiana has a continuous course of study, beginning on a Saturday of October and continued for one day of each month thereafter until March—in all, six days of institute instruction. Each day, or rather meeting, is divided into two sessions, the first of which ends at noon. We can not discern that either session has been devoted to the consideration of a special class of topics, but it is noticeable the purely pedagogical topics come just before or after the noon recess, and that the Reading Circle work—Hawthorne's *Marble Faun* being the volume for the year—is the third subject of the forenoon session. It is convenient to speak of the institutes and of the exercises in the order in which they occur.

First, or October Institute.—In the morning "Mistakes in Teaching Reading," chapters i-ix of the *Marble Faun*, "Elementary Number," and "School Government" are discussed. In the afternoon come "The Teacher's Preparation," "History of Pedagogy," "Mistakes in Language," "Literary Exercises Friday Afternoons," and finally a "Review of Longfellow's Poems," by way of an essay.

Second Institute.—"Penmanship," chapters x-xviii of the *Marble Faun*, "Elementary Number," "Methods of Instruction," come in the forenoon; "Opening Exercises" of the daily session of the common school, "History of Pedagogy," "Reading," "Germany" in its geographical, physiographical, climatic, and social aspects, and finally a written "Review of Bryant's Poems," in the afternoon.

Third Institute.—"Elementary Number," chapters xix-xxv of the *Marble Faun*, "The Recitation," "Physiology and Hygiene," and a paper on "Incentives to Study" occur in the morning session; and "Reading," "History of Pedagogy," "History of the U. S. Bank," "Vocal Music," and finally a paper as a "Review of Whittier's Poems," in the afternoon session.

Fourth Institute.—"Reviews and Examinations," chapters i-x of Vol. 2 of the *Marble Faun*, "Vocal Music," and "Reading" consume the hours of the forenoon, while "Physiology and Hygiene," "History of Pedagogy," "Primary Language Lessons," "Oral Arithmetic," and a paper as a "Review of Lowell's Writings" occupy the afternoon.

Fifth Institute.—"Drawing" is now taken up as a means of training, and is followed by chapters xi-xvii of Vol. 2 of the *Marble Faun*, "Primary Language Lessons," "Graduation from District Schools," and a paper on "The Teacher during Intermissions," which closes the morning session. In the afternoon "Reading," "History of Pedagogy," "Oliver Wendell Holmes" as an author, "Physiology and Hygiene," and finally an essay on "Indiana and her Schools, or the Teacher's Growth Professionally," follow in order.

Sixth Institute.—"Civil Government" is followed by the last chapters of the *Faun*, "Drawing" (as work this time), and "General Lew Wallace and his Writings." In the afternoon "Primary Language Lessons," "History of Pedagogy," "Physiology and Hygiene," "U. S. History—Accession of Territory to the United States," and a paper on "What is Needed in our Educational System to Secure Respect for Common Labor and Wage-Working" complete the work of the day and of the course.

The novelty of a series of outlines for township institutes will sufficiently justify the fullness of the preceding extracts, as well as a few words further upon the manner of presenting the purely pedagogical features of the course.

The text-book used for the "History of Pedagogy" is that written by Comparyé. The course begins with Lesson or Chapter 6, and the student, after glancing at the work of Luther and Comenius and of the pedagogues of Port Royal and the disciples of Loyola, passes quickly to Rousseau and his "state of nature," the beginnings of an educational Renaissance continued and developed by Pestalozzi, Froebel, and even by Herbert Spencer, though the last gives especial prominence to the utilitarian side. We have illustrated the method of studying Mr. Comparyé's in the chapter on reading circles.

Under the head of "School Government" five topics are discussed: (1) The purposes of school government; (a) to train the pupils in self-government and self-direction, (b) to secure industry, order, and regularity in school work. (2) The teacher's qualifications, which are determination, energy, self-control, order, knowledge of the subjects taught, a preconceived plan and sympathy. (3) Means of governing, which are (a) by training the will and forming correct habits of feeling, thought, and action, and (b) punishments. (4) Parental co-operation. (5) School recreations, through botanical, geological, or archæological collections.

Under "The Teacher's Preparation," as the teacher must thoroughly know what he is about to teach, it is inquired when his knowledge should be obtained, how it should be arranged in his mind, and as to the effect on his class flowing from lack of his preparation.

Under "Methods of Instruction" the matter is arranged under three divisions: The first, which deals with "Teaching Processes," maintains that instruction aims "to occasion the pupil's acquisition of knowledge and power" and "to impart knowledge directly;" that the functions of "Drilling" are "to deepen impressions and to impart skill of mind and bodily organs, to give power to apprehend again with ease and pre-

cision, and ability of pupils to rediscover or retrace knowledge," and finally to cause the mind to act in a desired direction by repetition. "Testing" is "to disclose results of instruction and drill and to arouse interest." "The objects of the lesson in the order of importance are to instruct, to drill, to test. The objects of the recitation in the order of importance are to test, to drill, to instruct.

During the year the county superintendents of Illinois have also prepared, as a tentative, such a programme which they call a "syllabus," that is, a programme of what is to be done at a certain time and how to do it.

This work consists of sixteen sections, pedagogy, language, reading, dictionary work and spelling, penmanship, number, geography, zoölogy, botany, drawing, grammar, physiology, and hygiene, United States history, the history of the formation of the Constitution, civics, physics, and finally morals and manners. Two of these, pedagogy and language, will receive our attention by reason of their importance, but before examining them briefly we will quote from the preface of the pamphlet as to the objects which the committee had in mind in preparing the course, for it appears that there were more than one.

"The aim has been to suggest work that is practical and within the reach of all teachers. It is believed that a careful consideration of what is here presented will lead teachers to a more careful thought upon their work and upon its methods. This is the end most to be desired. It by no means follows that every teacher, as a result of such thinking, will come at once to the wisest conclusions. It takes the experience of many persons and many ages to learn all the facts and principles relating to the teacher's work. The results of these experiences may be stated to some extent in words, and the statement may save the young teacher some perplexity and prevent his falling into error, but there is no substitute for the teacher's own thinking. It is better for him to fall into some errors as the result of his own careful observation and thought, than to accept without thought the wisest counsel. Let this syllabus, then, serve its best purpose by simply arousing the spirit of honest and thorough inquiry among the teachers. * * * Let the conductor of an institute make such selection as he thinks will be best for the purpose in hand."

The work of the section on pedagogy is distributed into five topics, each occupying a part of each of the five days of the school week. On the first day in the subject of "organization" the meaning of the word is inquired into. Why can not a library be organized? Why must a school be? Why is the day's work of special importance? On the second day the arrangement of the programme is considered. How do you proceed to make it, and how closely follow it? On the third day classification is up. Why necessary, its dangers, etc. On the fourth day, the functions of the teacher as a keeper of records. How is a schedule kept, how closed? What are the advantages of marking, its disadvantages? What should the marks express? On the fifth, the official relations of the teacher and his powers are discussed. What authority to make rules, suspend, expel? Why cultivate good feeling of parents; how induce them to take interest in school?

In school management, on the first day inside work is considered. The qualifications on the part of the teacher to have the pupil tidy, noiseless, busy; to make thoughtful, attentive, truthful, and polite. On the second day outside work is viewed. Should the teacher appear on the play-ground? Should he play? How suppress the bully, foul language, and gambling? On the third day the exercises would seem to lap with those of the fifth day of the subject "organization," though dealing more with the personal atmosphere of the teacher than his powers. Why has the teacher a right to govern the school? What rules are necessary? The evils of injustice, of acerbity, moroseness, temper. On the fourth day, "What is punishment?" is asked. Why necessary? Its proper and improper forms. May it be a kindness? On the fifth day the evils of misgovernment are discussed.

If we understand the typographical indications, the above subjects are for the "lower grade," and the following two for the "higher grade." First, "qualification of the teacher." On the first day the necessary connection between a good teacher and good school is examined. What are and how deeply he should feel his responsibilities? Is the expectation of pay a proper motive? Why should he insist on a fair compensation? On the second day the professional aptness, the physical condition, and the mental and moral characteristics of the teacher receive attention. Is the best scholar the best teacher? How does ill-health disqualify him? What mental, what moral characteristics should he have? On the third day the non-professionally-trained teacher is considered. We give the text in full. "Are teachers generally well prepared for their work when they begin? Why is this so? Is it possible to make preparation for teaching before one takes charge of a school? In what ways can it be done? (Give as many as you can.) If one who begins teaching without preparation becomes skilful at last, where does he acquire his skill? At whose expense has he gained it? Could he learn a trade in this way? Why is it not done? Does it follow that one who knows a subject well can certainly teach it well? What else must he know? Illustrations: How should a

teacher's knowledge of a subject—arithmetic, for instance—differ from that of one who merely wishes to make a practical use of his knowledge?" On the fourth day the teacher as an object lesson in manners, morals, conversation, and dress, is discussed, and on the fifth the professionally prepared teacher is considered. If he makes no progress does he remain stationary? What is thought of a lawyer without a library? What advantages accrue from attending professional meetings? Can he afford these things?

In the elements of psychology on the first day the mind as a whole is considered. Are all minds alike? How can we speak of the laws of mind? What is a mental faculty? Can education give the mind any new power? How does any mental power gain strength? On the second day the intellect, the feelings, and the will are considered; on the third day, memory and the "reflective power;" on the fourth day the use to be made of the emotions and the cultivation of the will, and on the fifth day attention.

Eight principles of mind, activity, and growth are given: Health; attention; self-activity, for there is no way in which a mind can increase in knowledge or power except by its own activity; mental acquisition and power are growths and require time; ideas and thoughts are not conveyed to but formed or awakened in a mind; the crude material for all that the mind knows or thinks comes through the sense; neither knowledge nor skill is ours until it has become habit; one can express intelligibly what is understood, and the attempt to make a clear statement tends towards clearness of thought. Some characteristics of children are attention in its lower form, the use of the sense to exhibit mental activity, muscular activity, imitation, faith, curiosity, memory, imagination.

The subject of language is divided into a primary division and an intermediate division. In the first the object is to instruct the teacher how to teach the pupil to speak correctly, (1) by easy and natural conversations, (2) by judicious correction of incorrect language as it is spoken; and to compare correctly, (1) by copying words and sentences, (2) by filling blanks in sentences, (3) by dictation, (4) by making sentences, (5) by combining short sentences. A distinct perception of objects is the basis of the child's language. Hence the instructor will find ample material for accomplishing the work, in familiar objects, in the reading lesson, in number work, and in children's books.

In the intermediate division very much the same course is pursued; geography, arithmetic, and history are to contribute their share in speaking, and to written work is added better writing and business forms. In this work the teachers are to be called upon to give illustrations.

LOCAL SUPERVISION.

We believe the necessity of having a superintendent is fully recognized in cities and within a few years Philadelphia, long a phenomenon in this respect, has acknowledged the value of such an officer by creating the office. If the general proposition of business life, that the poorer the workman the better must be the supervisor, be applicable to educational affairs, it is in the rural districts and not in the cities that the greater need for inspection exists. The county superintendency has long been looked upon as having this character, but in addition to the incumbent being occupied with other duties, to the exclusion of his duty as an inspector, the charge is frequently made against him of being a politician, receiving his office as a reward of activity in the caucus rather than in the school-room. How just or unjust this charge may be we are not prepared to say, merely referring the reader to the action in Indiana, Illinois, and Kentucky, which contiguous States appear to be, to use the expression of the weather maps, the center of this storm. "Divorce educational affairs from politics" is very observably the cry there, and it refers, if we are not much mistaken, to the appointment of county superintendents, for the charge against the appointment of teachers appears to be nepotism rather than political favoritism; but these charges have nothing like the vigor and number of the demands for educational qualifications on the part of the county superintendents.

The new examination code of New York, which the State superintendent thinks the most important educational event since the adoption of the common school system, is given under New York. Two other matters occur in the proceedings of the associations calling for notice. One is the establishment of a State certificate, as asked in Texas, for instance, and the other a suggestion that a column of the county newspaper be secured for education information of local interest. The last point is briefly discussed by the president of the State association of Kentucky, p. 422.

THE COLLEGE FOR THE TRAINING OF TEACHERS OF NEW YORK CITY.

The event of the year which particularly calls for our attention is the foundation of the college for the training of teachers, through the activity of the Industrial Education Association of New York City. From the source from which it sprang tendencies toward

manual training may be inferred, and indeed the necessity of new teachers for the "new education" has been the motive that led to its establishment.

In the thirty-third annual report of the board of trustees of the New Jersey State Normal School the following language is used: "Not normal school, but tradesmen teachers required if industrial schools for teaching trades are established," and under this caption the gentlemen of the board, after stating that "Teaching industrial pursuits is beyond the scope of the operations of the State Normal School," proceed to argue the question thus:

"The object of the State Normal School, stated in the law which created the school, is 'the training and education of its pupils in such branches of knowledge and such methods of teaching and governing as will qualify them for teachers of our common schools.'

"The public school system is framed to furnish the best instruction possible to all the children of a school age in moral culture and in the knowledge they must acquire to enable them to discharge the duties of life with fidelity, to be useful to themselves, to all they come in contact with, and to the commonwealth.

"The object is to impart the foundation-knowledge required for every position in life.

"The particular kind of education which must necessarily be acquired as an addition to the foundation-knowledge imparted by the teachers in our public schools, the pupil must either during the school age, or after it, acquire from other sources and by other means than the public school-room. The foundation-knowledge, however, must be not only thorough and complete, but so extended in its reach as to afford the underlying ground-work necessary for any of the useful employments which, in this day, fertile in inventions and surprising openings for occupation, call for and require the best prepared energy and skill in manual and mental labor of both males and females.

"How to prepare by suitable and needed education those who have acquired or are acquiring the foundation-knowledge taught in the public school, for the particular employment, manual or mental, which requires instruction beyond that afforded in the public school-room, is the problem.

* * * * *

"If the time has arrived for extending by legislation on the public-school system so as to provide daily or periodical instruction in industrial pursuits of a practical substantial character, not mere theoretical teaching, what shall be the method adopted? What practical business employments shall be taught? What qualifications will be required of instructors of industrial pursuits? In what way can industrial schools be connected with the present public schools so that the attendance of pupils at the two different kinds of schools shall be adjusted? will be among the many questions considered.

"While the public school as now conducted will continue to provide the foundation-knowledge requisite, the industrial school will provide the additional knowledge to qualify the pupil for the particular employment engaged in as the life-work of the pupil.

"The special teaching that would be required in the industrial school to so instruct pupils as to enable them practically to engage in the particular business taught, as employers or employed, would require special teachers and separate schools.

* * * * *

"Should legislation be deemed practicable and wise, it has not been suggested that there should be, nor does it seem practicable to make any change in the organization or operations of the State Normal School.

"The teachers required for industrial schools would be competent persons who are or have been practically, actively, and successfully engaged in the regular business of the occupation which they are expected to teach in the industrial schools where they would be employed, a line of teaching entirely outside of that for which the graduates of the State Normal School are qualified by the instruction they receive in the institution under the care and control of this board."

The Industrial Education Association, which believes that trade training, industrial training, or whatsoever it may be called, as such, has no place in the public schools, that "they are not to teach trades but to educate,"¹ naturally differs from the trustees of the New Jersey school, and has established a college for the training of teachers, which "is a professional school, and not a normal school in the usual sense of that term. The elements of a secondary education are not taught at the college, but are required of applicants for admission."

¹ See Chapter XV.

"It was at once apparent," says Dr. Butler, the president of the new school, "that to train persons equipped for a single branch of instruction only, and not to give them the basis of a professional training, was not to train teachers, but tradesmen; the graduates of such a college could be artisans, but not artists. It was seen that the time had come to extend the application of that fundamental principle of the association's work, which I have already mentioned. Industrial training, to have its fullest value, must be an integral part of general education, so that it should include the further statement, 'the teacher of manual training should be the teacher of the other class subjects and not a special teacher.' The importance of a single teacher for each class of children in the primary school can not be overestimated. At this age what the pupils most need is a constant, firm, and consistent influence exerted upon them. If the high school plan of department teaching is carried into the primary school this influence can not be exerted, and character training is sacrificed for doubtful gain in merely intellectual progress. There is another reason why the regular class teacher should also give the instruction in manual training. Any subject which is taught by a special teacher is regarded as an excrescence on the regular curriculum, and not as standing on the same level with reading, writing, and arithmetic. It would be fatal to manual training to create the impression that this is true of it. Manual training must be an integral part of the curriculum or it should not be introduced at all."

The question, then, being not how to train teachers of manual training, but how to train teachers who shall know how to teach manual training, the association answered it by establishing this college. It is not complete yet, and "years may pass before it will be." "It is not a normal school and is not intended to be such [that is, what is usually covered by that term]. The normal schools of this country are some of them excellent, many of them poor; * * * they are academies or high schools with a slight infusion of pedagogic instruction. They certainly are not to the profession they represent what the law school, the medical school, and the theological seminary are to their respective professions. * * * The training college which this association has founded is a strictly professional school. The course of study is two years in length, and is designed solely to train broad-minded, cultured, professionally trained teachers. It is based on psychology and includes also the history and science of educating methods of teaching, including the subjects included in the term manual training, observation, and practice in the model school, the theory and practice of the kindergarten, natural science, including the construction of simple illustrative apparatus, and history."

The candidate for admission must be at least eighteen years old and have graduated from an approved high school or academy. Graduates of normal schools and colleges are admitted without examination. All other applicants are rigidly examined in arithmetic, plane geometry, history, geography, elementary science, and English. Drawing will be added in order to emphasize its importance as a school subject.

The pupils in attendance may be classified under four heads: those in the college course, 18; those called special, 86; the children of the model school, 64; and the children called special students, 508. Of the adult special students, 39 pursued a course in "industrial art;" 28, sewing; 18, domestic economy; 4, domestic economy and sewing; 4, mechanical drawing; 1, wood-working; and 1, observation and practice in a model school. Of the 104 regular and special students, but 8 were men. Dr. Butler thinks it quite safe to assume that the demand for men to introduce and supervise manual training for boys will rectify this inequality in the representation of the sexes at his institution.

The model school has a grammar grade of 20, a primary of 16, a kindergarten of 28. Of the 508 children in special classes, 116 are taught sewing, 167 domestic economy, 142 "industrial art," and 83 wood-working.

We give the programmes of the special classes below. The teachers' training course has been given above in the language of the president of the school.

Schedule of Special and Extra Classes for Adults, and Assignment of Teachers—Second Term, 1888.

Monday.	Tuesday.	Wednesday.
<p>9.30. Domestic Economy: Ladies' Class No. 3, Mrs. Sherwood.</p> <p>10.00. Sewing: Ladies' Class No. 1, Mrs. Roberts.</p> <p>2.00. Sewing: Normal Class No. 1, Mrs. Fisk.</p> <p>3.30. PEABODY NORMAL COLLEGE.

Although hardly giving the late State Normal College at Nashville the character of a national institution, the recent change of name by the authority of the Tennessee State board of education to Peabody Normal College distinctly marks it as a normal college for all the Southern States—"The Normal College of the whole South." It is well known that the trustees of the Peabody Fund annually expend nearly \$33,000 for scholarships and salaries at this institution, and it should not be forgotten that Mr. Peabody's purpose was "that the benefits intended shall be distributed among the entire population [of the Southern and South-western States] without other distinction than their needs and the opportunities of usefulness to them." Animated with the justice of this consideration, and perhaps not unmindful of the benefits immediate and prospective to be derived from having an institution so powerfully supported within the borders of their State, the action above referred to has been taken by the members of the State board on their own motion.¹

The organization of this institution is highly complex. Three boards are concerned in the management; the Peabody board of trustees, which furnishes by far the largest amount of money, the State board of education by virtue of an annual State appropriation of \$10,000, and the board of trustees of the University of Nashville, who own the buildings and grounds. That conflict has been avoided, there being so many authorities, is an evidence of the subordination of personal or local feeling to the interest of the cause of education in the South.

This singular juxtaposition of authority seems to have been caused by the necessity of making the compromises ever required when the result is to be moral rather than pecuniary gain. When in 1874 or 1875 the Peabody trustees found it necessary, as it has always been found necessary, to have professional teachers, and determined to provide them by establishing a normal school and, Nashville having been selected, made

¹ It is an open secret, we believe, that when the Peabody Fund is distributed, at the expiration of the limit imposed by Mr. Peabody, a large portion of it will be used in endowing or founding a normal college.

overtures to the State Legislature of Tennessee, they were refused. The State was too poor. But the trustees of the University of Nashville gave the use for two years of its grounds, buildings, and funds to the proposed school as represented by the State board of education, and the Peabody trustees \$6,000 per annum. The principal condition exacted by the university board being "that its [the proposed school's] principal officer and his assistants should be selected and their compensation fixed by the university board." The State board accepted the proposition of the university, and stood sponsor to the school. In 1876 the \$200 scholarships for the benefit of all the States aided by the fund were established, twenty-five being offered. It was not until 1881 that the State made the first appropriation, amounting to \$5,000.

The recent death of Dr. Stearns, the head of the school, brought out sharply the question of the power of appointing a successor. The chairman of the Peabody trustees took the initiative, and appointed William H. Payne, professor of the science and art of teaching in the University of Michigan, to fill the vacancy; this nomination was subsequently confirmed not only by the Peabody trustees, but also by the two Tennessee boards. As to the question of jurisdiction there may have been a doubt, but none whatever as to the wisdom of the choice. In his report to the Peabody trustees the new president says:

"It gives me great pleasure to record the fact that only one spirit animates the State Board of Education and the Board of Trustees of the University of Nashville—that of devotion to the prosperity of the Normal College. Both these boards have not only seconded all my efforts for perfecting the organization and equipment of the college, but so far as possible have anticipated my wishes and plans, and have granted me all the material aid within their power.

"So far as I have been able to interpret the sentiment of public-spirited citizens in Tennessee and in the South in general, it is that of cordial sympathy with the purposes and plans of the Normal College. The State superintendents, particularly of the States having Peabody scholarships, are all active friends of the college, and have most cheerfully and efficiently co-operated with me in making its advantages known to the educational public of their respective States, and in conducting the examinations for scholarships according to the plans which I have proposed.

"The growth of public interest in the Normal College is attested by what I think to be a typical fact reported from Virginia; namely, last year there were twenty-three competitors for nine vacant scholarships, whereas this year there were fifty-four competitors for five scholarships.

"One of the most hopeful indications of the approaching collegiate year is the formation of a Baccalaureate class of considerable size. Most of the students who will compose this class are graduates of collegiate institutions of the South, who take this opportunity to extend their professional education. The preparation of teachers for the higher positions in the public school service of the South I take to be the characteristic aim of the Peabody Normal College; and my purpose is to raise the grade of instruction as rapidly as prudence permits. The Peabody education fund is most wisely expended in educating teachers who will occupy commanding positions where they themselves shall become the educators of teachers.

"* * * There were graduated in May, 1883, twenty-four young men and twenty-three young women with the degree of Licentiate of Instruction. As the college offers unequalled advantages for professional instruction at a merely nominal cost (\$6 a year), I hope the attendance of non-scholarship students may be gradually extended from year to year.

"Recollecting that this college is a *professional* school, and not an institution for mere academic instruction, I have organized courses of study in the theory, history, and art of education, and which are more comprehensive than those given in any other institution in the country.

"The most pressing need of the college at this point in its history is a library. A part of the necessary equipment of a high school is a library of good books; but this college is virtually without a library of modern books. The university and society libraries contain about ten thousand volumes; but these collections were made, in the main, fifty years ago, and need to be supplemented by several thousand volumes of modern books. I purpose to catalogue the existing libraries, and I shall feel greatly helped if your board will set apart a generous sum for the purchase of books. It is only with the strictest economy that the ordinary current expenses of the college can be paid from the sums at the disposal of the State and university boards.

"As you know with what reluctance I severed my connection with the University of Michigan in order to accept your call to the presidency of this college, I feel it my grateful duty to assure you that I am much more than pleased with the change I have made; and wishing to carry out the plans and purposes of your board to the extent of my ability."

NATIONAL NORMAL COLLEGE.

The necessity for trained teachers for the schools being as real as that for trained officers for the Army and Navy, the want would undoubtedly have long since been supplied had the National Government had the control of the teaching body as it has of the lighting. Although, having no jurisdiction in the matter of education, a powerful influence might be exerted by the establishment of a school for the professional training of well-educated persons by the General Government. The results of the action of the Peabody Fund trustees is an evidence of the influence that may be exerted in this way.

A bill was introduced during the last session of Congress to "establish a national university for the education of teachers," to be known as "The National University," with such a course of study as would appear to render it liable to the objections which are now being so openly made against the normal schools.

Training in the profession of teaching, it seems, is not the feature of the instruction which the institution is to afford, but a co-ordinate department; in fact, the university is but a national normal school, with the academic features that the State normal school is trying so hard to get rid of. The candidates for admission are to be versed in reading, writing, arithmetic, and to have a knowledge of the elements of English grammar, geography, and history of the United States, and there is to be a very large number of appointments, and the pupils are to be retained in the pay of the United States as long as they remain in the institution itself or teach in the schools of a State after graduation. Whether this is wholly to provide against the mean pay that teachers, especially country teachers receive, or in part to keep the ladies, one-half of the appointees, who graduate in the profession for which they have been educated, we do not know, but give the bill in full, that the reader may judge of its various provisions as the first tentative of the kind.

A BILL to establish a National University for the education of teachers.

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That there shall be established in the District of Columbia an institution of learning to be known as "the National University," for the purpose of educating teachers, at which shall be taught the English language and literature, mathematics, the natural sciences and mechanic arts, and particularly all such branches of education as will make students proficient in the art of teaching in the common schools of the several States and Territories of the United States and the District of Columbia, and such other studies as the board of regents of the university may prescribe. No partisan or sectarian doctrines shall be taught, and the institution shall be, in the selection of officers, instructors, and employes, strictly non-partisan and non-sectarian, and the board of regents, and all other persons participating in the management of the institution, are especially charged to faithfully observe and comply with this provision.

SEC. -. That the university shall be under the control of a board of regents, consisting of the Secretary of State, Secretary of the Treasury, Secretary of War, Secretary of the Navy, Postmaster-General, Secretary of the Interior, and Attorney-General, who shall have full power to select a site and purchase the necessary grounds in the District of Columbia for the purposes of the university. They shall have power to employ experts and other persons to lay out the grounds, make plans and specifications for the necessary buildings for the university, and to cause the same to be constructed; and also to appoint a president of the institution, who shall hold office during good behavior, and either appoint, or prescribe regulations for the appointment and removal by the president of the university of all necessary professors, teachers, and employes of the institution.

SEC. -. That the president and professors of the university shall constitute the faculty, and have the management of the university, regulate the course of studies, and grant diplomas to students who have creditably completed the course of studies, under such regulations as the board of regents shall prescribe.

SEC. 4. That the salaries of all the appointees of the university shall be fixed by the board of regents until Congress shall otherwise prescribe. And the board of regents shall have authority to employ such clerical or other assistance as may be necessary in the execution of the duties required of them by this act, and fix their compensation.

SEC. 5. That tuition, rooms, board, lodging, text-books, and stationery shall be furnished for the students by the United States free of charge.

SEC. 6. That the course of instruction shall be four years. The President of the United States shall annually appoint to the university fifty students. Each Senator and Member of Congress, including Delegates from the Territories, shall appoint to the university one student, a resident of his State, district, or Territory, as the case may be, each year. Students shall be appointed one year in advance of the time of their admission to the university, except in cases where, by reason of death or other cause, a vacancy occurs

which can not be provided for by such appointment in advance, and in case of such vacancy an appointment shall be made to fill the same by the officer whose duty it was to make the original appointment, as hereinabove provided, or by his successor in office.

SEC. 7. That both males and females shall be admitted to the university. The regents shall regulate the first appointments so that one-half shall be males and the other half shall be females, after which the appointments shall be made of the different sexes at each succeeding year, and the appointments to fill vacancies shall be so made that the number of males and females in the university shall at all times be as near equal as possible: *Provided, always*, That if the requisite number of either sex do not apply for appointment to the university, appointments of the other sex may be made without regard to the relative number of males and females in the institution. Appointees shall be admitted to the university only between the ages of seventeen and twenty-two years.

SEC. 8. That the appointees shall be examined under regulations to be prescribed by the faculty before they shall be admitted to the university, and shall be required to be versed in reading, writing, arithmetic, and to have a knowledge of the elements of English grammar, descriptive geography, particularly that of the United States, and of the history of the United States.

SEC. 9. That each student shall, previous to his or her admission to the university, take and subscribe an oath or affirmation, in the following form:

"I, A B, do solemnly swear that I will support the Constitution of the United States and bear true allegiance to the National Government; that I will maintain and defend the sovereignty of the United States, paramount to any and all allegiance, sovereignty, or fealty I may owe to any State, county, or country whatsoever."

And shall also give the following pledge:

"I, A B, hereby give my pledge of honor to faithfully observe the rules and regulations of the National University, and to apply myself diligently to the course of studies prescribed; and that I will devote my time and attention to the business of teaching for at least ten years after I shall have graduated, and will during my whole life aid the cause of education in such manner as I may be able to do, consistent with my circumstances and occupation."

SEC. 10. That students of the university, while pursuing their studies in that institution, and after graduating therefrom, while teaching in common schools or in State or Territorial institutions maintained for the purpose of instructing students in the art of teaching, and complying with the rules prescribed for their conduct, shall, in addition to any compensation they may otherwise receive for their services, be severally paid out of the Treasury of the United States the sum of twenty dollars per month.

SEC. 11. That both the students and graduates of the university shall conform to rules and regulations as to good behavior, reputable conduct, and fidelity to the cause of education prescribed by the faculty with the approval of the Board of Regents; and for non-compliance with such rules and regulations a student may be dismissed from the university, and the diploma of a teacher may be cancelled and the teacher dismissed from the service of the United States after an investigation, under such rules and regulations as the faculty may prescribe, with the approval of the Board of Regents.

SEC. 12. That it shall be the duty of the Board of Regents to require full reports from the faculty and all officers and agents appointed by them, annually, on the first day of November, and transmit the same to the President of the United States, with such recommendations and suggestions as they may deem proper.

SEC. 13. That the sum of one million dollars is hereby appropriated, out of any money in the Treasury not otherwise appropriated, for the purpose of carrying the provisions of this act into effect.

PHYSICAL AND MANUAL TRAINING IN NORMAL SCHOOLS.

"Education," says M. Jules Rochard, of the French Academy of Medicine¹, "is nothing more in the last analysis than transmitting to those who are entering life the knowledge of those who have preceded them, and the larger the fund the more complicated education becomes. Each step made in advance along the way of civilization, each conquest realized in the domain of intellect, appears as an addition on the already-overloaded school programme."

It is true that M. Rochard is speaking more particularly of the French lycée (college), but we think his remarks quite appropriate to a page that has to record the addition by the Legislature of New York of instruction in manual training to the programme of the State normal schools.

We find that these schools are objected to by the president of the New York College for Training Teachers and of the Industrial Education Association as not professional

¹L'éducation hygiénique et le surmenage intellectuel. *Revue des Deux Mondes*, 15 Mai, 1887.

schools, as not like his own, training technically persons already educated. Thus it appears that to the functions of educating and professional training is now to be added that of manual training. Besides this, it is very certain that the kindergarten is gradually becoming a part of the normal school course, although this subject, it may be said, is the beginning and a part of manual training. In addition to these the gymnasium is thought essential in preparing the teacher for professional work, as is shown by the remarks on the subject by the State superintendent of Connecticut who speaks to this effect:

"The end for which this instruction is given is not amusement nor to confer an accomplishment, but that the graduates may have sound bodies, and so be able to teach a school better; for the relation of teacher to scholar implies that the children have confidence in the teacher and that the teacher is worthy of confidence. No teacher with a weak body and resulting infirmities of mind can long retain the confidence of children. It is urged against teachers that as they advance in years under their exhausting duties they lose freshness and vigor of body and the elasticity of mind which commend them to the young. Ill health is apt in addition to absorb the attention of the sufferer and a desire for higher professional attainments has no place."

In his last report the State superintendent of California observes: "Every one will admit that a teacher should possess scholarship, training, and culture. He should also possess a sound body. Good physical strength and ready flow of animal spirits are requisites in the teacher, that he may be able to withstand the nervous strain and command the attention and respect of his pupils. Without this his work will necessarily be defective, unsatisfactory to his pupils, and painful to himself."

Manual training in any of its elementary forms, wood-working in the upper grades, and the exercises of the manual training school properly so called, not being classed as elementary, is not a substitute for gymnastic exercises. It furnishes tangible objects of thought, but while exercising the mind, is not equally adapted to exercising the whole body. And the presence of many ladies at these schools, two-thirds of their enrolment, causes difficulty when the attempt is made to supply the necessity for physical exercise; that is, exercise given in a systematic way with a definite end in view; for them calisthenics and the lighter gymnastics are adapted as they are not adapted to men.

The French physician from whom we have quoted, after observing that overpressure in schools is the question of the day, and that recently it had been carried to the Academy of Medicine and even to both branches of the French Legislature, and that the "American formula," which, dividing the day into three equal parts, devotes one of them to study, is the best, proceeds to make some suggestions as to the means through which the hygienic education may be obtained in the case of boys.

Eight hours should be given, this author thinks, to meals, the toilet, recreation, bodily exercise, and music and dancing, etc. Recreations (plays) ought to be longer and more utilized, because the students engage in them spontaneously when time and encouragement is given, nevertheless it is well to insist upon physical exercises which are not play properly so called. Gymnastics should occupy the first place in such exercises on account of its accessibility and the variety of movements it permits. It will not be difficult to render the work attractive, but it is necessary to remind the instructors that the pupils are to be made vigorous and agile and not acrobats "or clowns." To give regularity to the instructions it is necessary to have two gymnasiums, one under cover and the other in the open air, as has been done at the Lycée at Vanves. "The necessary complements of gymnastics," continues the author, "are fencing, horseback riding, singing, and swimming. The first is an excellent exercise.¹ Independent of the vigor, agility, and precision of movement that it develops better than anything else, it gives to young people a confident and easy air much more becoming at their age than the stooping form of those who have grown pale over their books. Horseback riding has its place in a liberal education for the same reasons, while swimming is of all exercises the best for hardening the body. It calls into play muscles which are habitually in repose and develops the chest by the deep and long inspirations which the process demands. These efforts are not accompanied by loss (*dépédition*), since they occur in cold water, and to the muscular activity is added the tonic effect of the cold bath. Useful to all men, swimming is necessary to those who live upon the shore of or near a river. It is astonishing that so many persons are found in the pavy who can not swim. Singing has not the same importance, but it is very useful in developing the lungs, and of all the æsthetic recreations (*arts d'agrément*) it is the most hygienic. Hygienists are unanimous in asking that it be accorded the place in education that it ought not to have lost."

¹ "Those who are cribbed, cabined, and confined by office work and the wearing life of towns find that fencing is as near as possible to perfection as an exercise. Encouraging, as it does, self-control, forbearance, fair play, and most of the minor virtues of good breeding; admirable as a training-school for the quick eye, the ready wit, and the light strong hand, * * * it is only just that fencing should be called the fine art of athletics."—Henry Eckford, in the *Century* for January, 1887.

It is not necessary to say that the hygienic education given at our normal schools has but one, perhaps two, of the features advocated by the French physician, gymnastics and singing. From the returns made by principals we find that gymnasiums are not uncommon, and calisthenic exercises are quite frequently a part of the school work either daily or at intervals during the week. In several instances a special teacher is employed.

Manual training has been introduced into several schools, taking the form of wood-working for men, and cooking and sewing for women, and "construction work." In several instances we are informed that preparation is being made to introduce the subject.

Under the head of Pennsylvania (p. 444) we have given a brief account of the introduction of cooking into the normal school of Philadelphia.

PROCEEDINGS OF THE NORMAL DEPARTMENT OF THE NATIONAL EDUCATIONAL ASSOCIATION AT CHICAGO, 1887.

The president, Mr. Taylor, in opening the meeting spoke of the value of conventions. When physicians convene they find profit in listening to the experience of others in treating disease. Why should not they meet to discuss the means and methods of mental growth? They had theory and fragmentary reports, but the rank and file are not finding them helpful. In the speaker's intercourse with teachers a lack of acquaintance with pedagogical authorities was most noticeable, and they practiced the best methods with so slight a comprehension of their value that a smile or sneer would cause them to be discarded. The science of pedagogy has no Kent, no Blackstone yet. Rousseau should be read, we are told, but he was a mere dreamer, is added; Pestalozzi should also be read, but he is an enthusiast; Froebel all should know, but then he must be adapted; Rosenkranz is great, but hard to digest, etc. Of course it would be unwise to follow any one author blindly, but as the teacher does follow some kind of authority is it not proper that he should know what the more experienced in the profession recognize as wisest and best? "We meet and talk and resolve, but do we accomplish what we might for the humble toilers in the 250,000 school-houses in our land?" This service was not to be accomplished in one year or in five. It was begun at the preceding meeting and was to be continued at this. The reports to the association should be digested that teachers might utilize it. The profession looks to the normal schools to examine, sift, and value the new methods, factors that are constantly appearing. Let there be a consensus of opinion put in plain language to serve as an authority to which teachers can appeal in their contests with patrons, boards of control, and superintendents.

President Gray, of the St. Cloud State Normal School, discussed the "Methods of instruction in the normal schools of the United States." He regarded this as the most vital question before the normal schools. He had prepared and sent out a series of thirty-two questions in May, 1887. Of the one hundred and seventy-five schools bearing the name normal to which the questions were sent, seventy-four were returned in such shape as to make them of value. He had no thought of generalizing on the data; that was a dangerous process to any but the most patient observer of facts. Impressions, then, not judgments, were to be given. His paper may be briefed under the following heads:

What do not normal schools teach?—He found forty-seven different terms used to describe the course or courses of study in these schools. Excluding those differing in name only, a large number remained to show how chaotic are the curricula in schools nominally existing for the training of teachers. If the normal schools would have themselves respected as technical schools they must have technical courses.

Methods.—Forty-eight schools report a special teacher in methods; four, "all are such;" two, "several;" two, "five," and one, "eight." A course in "methods" is usually a course in the common-school branches, but a few cover everything by this term, even psychology and even practice teaching. The fifty-seven schools answering the question as to what subjects are taught under methods and as to a special teacher of them, regard the subject as necessary in a normal course. The time given varies all the way from two to twenty months. The average time for the fifty-seven schools may be placed at eight months, one recitation daily, though throwing out the time given to mental science this average is reduced to six months.

Psychology.—Out of the seventy-four schools reporting fifty-nine have mental science, in a large number of cases without the text-book. The average of fifty-eight schools is about four and one-half months, a lesson daily. In twenty-two schools mental science precedes "methods," in nineteen it follows, and in thirty-one accompanies (thirteen answering so as to be counted twice). Not more than ten seem to have concluded that psychology is the foundation upon which the art of instruction is built.

Practice teaching.—Fifty-five schools have practice teaching done in a school of chil-

dren, and these, variously called "training schools," "practice schools," or "model schools," are nearly all connected with the normal school. Twenty-two have student-teachers' practice upon a class made up of the classmates of the pupil playing teacher. Twenty of the twenty-two schools are not very favorable to the plan, some decidedly unfavorable. "Like Hamlet, with Hamlet left out," says one. The average time devoted to this for forty-eight schools is about one hundred and seventy-five recitation hours of forty-five minutes each; a very few schools reaching four hundred to five hundred hours, apparently of sixty minutes each. This seems to be the *sine qua non* of professional training, and out of the sixty-one schools placing a high value on practice teaching, fifty-seven are State or city institutions. It seems that under competent supervision this work is not so bungling a process as is the work of the untrained teacher without such supervision. The practice is placed as far along as possible following methods and psychology.

Observation.—About half the schools report observation as a part of the course, being usually a part of the system of criticism in which the pupil teacher is by turns critic and teacher. In some cases this system has been forced upon the school from lack of children to form a sufficient number of classes. Many schools declare that the time spent in "observation" is wasted; others have abandoned it for actual teaching. The schools valuing it agree in saying that the teacher must be prepared "to observe," "must know what to look for." The average time taken in the schools reporting is three and a half months.

Other professional studies.—Forty-four schools report history of education as a part of their course, giving it three months and a quarter. Forty-six include school economy and devote to it, on the average, three months. Thirty-four have introduced the science or philosophy of education, devoting to it, on the average, three and one-third months. Forty schools think a kindergarten desirable; nine not; only seven have one.

The answers generally agree in recommending the catechetical method for children, for advanced work, and for testing pupils; the topical, for older people, to cultivate freedom of expression and logical arrangement, and as supplementary to the former. The lecture method is used in advanced grades only and re-enforced by catechetical and topical review. Questioning is the art of the teacher, all admitting its value. A few schools require a plan of operations to be drawn up by the pupil in the method or practice class preparatory to work, but most require nothing beyond a general statement of subject matter and plan, leaving the adaptation to the inspiration of the moment. To avoid parroting almost all replying would refer every special method or device to its underlying laws.

The answers to the last two of the questions, calling for the characteristics and causes of failures of normal schools, are discussed by Mr. Gray in the following terms:

"After fifty years of growth it would appear that the normal school has not taken the rank in this country that its assumed importance would lead us to expect. Either there is, or there is not, a necessity for such schools. The answers generally agree that the normal school trains teachers; that their aim and outlook are quite different from other institutions; that they are technical schools in education, as schools may be found in medicine, law, and theology; but when we come to the replies upon the causes of failures there is a general wail because of a lack of appreciation on the part of the public, a lack of intelligence among legislators, a lack of preparation in scholarship among the students who enter, a lack of sufficient time for professional work, because of too much academic work, too much preparatory work, too little skill on the part of normal teachers, etc. The impression one gets in studying the replies to these questions is that the normal schools are not satisfied with the work they are trying to do. They are under restraint. What they would do they do not, and that which they would not they do. * * *

I want to take time to remark that in my judgment we, the normal school men, are more directly responsible for the estimate upon our work than any other persons. * *

* When the friends of the theory that teachers can be trained as well as ministers and doctors demand such training on the part of those in high places, the absurdity of the untrained superintendent in charge of the trained subordinate will be done away with. * * * In a word, the way in which to make good the assumption underlying our schools is to make it disgraceful for business colleges, academies, high schools, seminaries, colleges, and universities to masquerade under the name of normal schools to catch gudgeons and fill their treasuries, to the shame of a noble calling, and to place our schools upon the basis of a liberal course of study, to be supplemented by a liberal course in the science, history, and art of education."

Professor De Ganno's paper on the German system of normal schools we hope to use in connection with work for a subsequent report, and will proceed to consider the paper of President Albee, of the Oshkosh school, on "Conditions of Psychology in Normal Schools," premising that as the paper is not on the *condition* of psychology in our normal schools we may be brief.

Institutions, said Mr. Albee, are embodied ideals; then of what ideals is the normal

school the phenomenon? Systematic education is but the purpose of the present, "to transmit to immediate posterity all the vantage of its highest conceptions of manhood, and its clearest views of the determinate lines on which human progress must be made," and the normal school is of recent origin only in the sense that its latest phase is necessitated by its environment. This striving to guide the rising generation along lines of least resistance was no less definite among the Hebrews than among us. Two kinds of obstacles impede late efforts. First, immaturity and mediocrity flock to the normal school to be made up or made over again, in the briefest time, entailing a limitation in culture and methods which has strongly tended to fix its necessities as the permanent ideal governing normal schools and determining their province. Second, the habits of thought engendered while gaining the indispensable acquisitions of knowledge are not favorable to introspection. The mind has done well to observe and infer, without turning aside to analyze, the modes and causes of its activities; and, in addition, to the half-grown intellect rules are a necessity to satisfy the craving after the definite, causing the obvious and immediate to exert undue influence, and the teacher to exalt direct teaching and instruction above its merits when compared with the excitation and infiltration of thought through its manifold less prominent relations. One favoring influence must not be overlooked. In the normal school much more than in the college the sentiment prevails that psychology is the foundation for all high excellence in teaching, making it a profession and not a trade. As outlining the attitude the normal school men should assume or avoid, three statements may aid: First, psychology must not be pursued simply as one branch among the multitude of other subjects needed in rounding out scholarship, to be as a mere acquirement; second, it should not be treated as a field for sharpening the pupils' wits by comparing opposing theories; but let it, third, be taught as the general science underlying all school work.

THE PEABODY FUND.

The most important event to be noted in this connection is the resumption by Dr. Curry of the office he formerly held. During the interregnum (we know of no better term to express the interval) Dr. Green, the secretary of the board of trustees, did double duty, being secretary and general agent *pro tempore*.

The amount distributed by the trustees for the year beginning with October, 1887, has been \$67,600. Of this sum \$22,800 has been granted to the Peabody College at Nashville, in the shape of one hundred and fourteen scholarships and \$10,000 in gross; in all, \$32,800. To other normal schools \$13,000 have been granted, and for institutes \$11,400. The rest went to several public schools.

The distribution of the scholarships at the Peabody College at Nashville is as follows:

Alabama.....	13	Tennessee.....	14
Arkansas.....	10	Texas.....	9
Georgia.....	14	Virginia.....	14
Louisiana.....	8	West Virginia.....	8
North Carolina.....	14		
South Carolina.....	10	Total (value \$200 each).....	114

To the States individually were distributed the following amounts:

States.	For Normal Schools.	For Institutes.	States.	For Normal Schools.	For Institutes.
Alabama.....	\$3,000.00	\$1,000.00	Tennessee.....	\$10,000.00	\$1,200.00
Arkansas.....	1,500.00	1,500.00	Texas.....	2,000.00	
Georgia.....	1,200.00	1,200.00	Virginia.....	2,500.00	2,000.00
Louisiana.....	2,000.00	1,000.00	West Virginia.....	1,000.00	1,500.00
North Carolina.....		1,000.00			
South Carolina.....	2,500.00	1,000.00	Total.....	23,000.00	11,400.00

a In addition to the scholarships.

The courses the annual apportionments have taken are most clearly shown by the following statement, prepared for the secretary by a member of the finance committee:

Distribution of the Income from the Peabody Education Fund from 1863 to September 30, 1888.

Years.	Alabama.	Arkansas.	Florida.	Georgia.	Louisiana.	Mississippi.	North Carolina.	South Carolina.
1868.....	\$1,000.00	\$8,562	\$8,700	\$1,338	\$2,700	\$3,550
1869.....	5,700.00	\$4,300	\$1,850	9,000	10,500	9,000	6,350	7,800
1870.....	5,950.00	11,050	6,950	6,000	5,000	5,600	7,050	2,950

STATISTICS OF THE YEAR.

We are sure that any one who is inclined to deny that words as signs of ideas are *things* of the very highest importance would be convinced of his error had he one of the annual forms of inquiry sent out by this Office to make up and to note the great variety of acceptations in which apparently the most leading questions may be taken by gentlemen of intelligence and learning. It seems impossible to phrase a series of questions so that each will be understood by the majority and yet not misunderstood by a few. "As I expected would be the case," says President Gray, of the State Normal School at St. Cloud, Minn., "some of the questions [to a circular inquiry lately sent out by him] were not understood by all alike, owing to the different meanings attached to words;" while Superintendent Gillespie, of the Nebraska Institute for the Deaf, in commenting on one of the answers to a certain inquiry sent out by him, says that he *thought* that all understood the phrasing in the same way. Some of the most important inquiries on our form for normal schools are useless from this cause.

But the statistics of normal schools are only a co-ordinate section of this chapter, and represent the operations of the machinery for producing more or less professionally trained

persons for teachers. Do they tell how many of the graduates teach and how long? Have we any reliable information of the number of men and women who taught during some part or the whole of 1886-87, and were teaching for the year under review? How many new classes have been added to each system?

In default of these essentials of comparison, the statistics of normal schools, being out of relation with the demand for the service of those they train, are of no value in showing how the balance between supply and demand is maintained; and this, we take it, is their value. We are not entirely without statistics, however, as to these important points, and though they are but the most meagre they are not inadequate, for they all agree in pointing the same way, the variations occurring being caused by local circumstances.

But we would not venture to use these fragmentary statements had we not consulted the recorded experience of men in the field. Of statistics, indeed, it may be said as Bacon says of studies, "they teach not their own use, but that is a wisdom without them and above them won by observation."

DO THE NORMAL SCHOOL GRADUATES TEACH?

From cities and towns not having normal schools or classes the cry is persistent for one; the State normal schools are not meeting the demand. And yet "It is idle to think that the time and money involved in pursuing a normal school course will be given to obtain the miserly salary of a country school, with the probability of losing that before a year," says Superintendent Draper, of New York.

Thus, according to Mr. Draper, the salary of the country school excludes the graduate of a normal school, and yet, this large field of activity being closed, the cities are asserting with the utmost positiveness that the State normal schools are insufficient to supply their local need. Under such circumstances the inquiry, "Do the graduates teach?" is suggested, an inquiry that from its frequent repetition is heard with some impatience by the president of the Winona State Normal School.

Leaving out the much canvassed fact that about 70 per cent. of the attendance at the normal schools of the country are females and that their assumption of the marriage relation involves their withdrawing from the profession of teaching, we find that with men it is merely used in many cases as an expedient to a better and more lucrative employment, not to say profession. It is evident that a talented lawyer, physician, or theologian is socially and financially of much more account than a talented school-master. Thus we are constantly reminded that the interest that each has for his own advancement and reward is not suspended in the case of the profession of teaching, that ability will not see itself passed in the struggle for reputation and wealth, content because doing good; for that is a celestial, not a business virtue.

The constant inquiry at every session of the Minnesota Legislature as to the service—two years in that as in most States—performed by the graduates of the normal schools, an inquiry instigated by the belief that the obligation is not fulfilled, has wholly or in part caused a thorough canvass to be made of the professional activity of the graduates of the Winona school. This canvass was conducted through the class historians of the alumni association of the school. From every class reliable data has been obtained, showing "that the average term of service of all graduates has been five and one-half years for each person, or nearly three times the service required by the State, and about twice the average term of service of all other classes of teachers. About five per cent. only have not taught. Nearly all of these have secured their release from the pledge by paying to the school the full amount of the tuition for the time they were in attendance. Less than two per cent. have failed to redeem their pledges.

"There are now teaching in this State," says the State superintendent of New Jersey, "three hundred and three graduates [of the State school], this being about 26 per cent. of the whole number, and about 64 per cent. of the number of graduates within ten years."

As the tuition at this class of schools is free on the condition that the pupil obligates himself to teach in the schools of the State for a certain period, generally two years, it would seem inevitable from a purely logical standpoint that the graduates would become teachers or perjurers unless buying themselves off. The last two classes, as we have seen in the case of the Winona school, are very small, too small for notice if the investigations cover the whole period of the school's existence since 1860; but it is the average time of teaching that claims our attention.

Assuming that the statistics of the Minnesota school are typical of the class, a type, not an average obtained by huddling the high and the low together and striking a mean in a Procrustean way, they may be viewed, we think, in two lights, which for convenience of reference we will call the practical view—the limitations of manner of selection, entrance examination, facilities of "completing an education," and short term of obliga-

tion being considered—and the professional view. As the first of these is the fairest, we will briefly consider it.

In establishing these schools it is proper to assume that the civil authority was acquainted with the need that it was called upon to supply, and that in supplying it it used the most effectual and immediate method. If two years were established as a term during which the pupil was to teach in the State it must have been deemed an equivalent for the instruction given for two years or so at the school. And if that term is lengthened to five years, as at the Winona school, it follows that the State has more than doubly been paid.

The professor of didactics at the University of the Pacific can only say for these schools that they have done not a little good in preparing academically trained teachers for the schools; the president of the New York College for Teachers, that they only give a tincture of professional training; while the principal of the Castleton (Vt.) school says that training in the studies the pupils are to teach is all that is necessary. For the last gentleman our so-called practical view is also the professional view; for the others something more than a comprehension of facts is necessary; they demand a knowledge of the child.

But in a professional sense the term of five years of teaching is far from satisfactory. It is quite the fashion to compare the profession of teaching with those of medicine, law, and theology. Those who engage upon these studies look upon them as a life-long occupation, as a profession, not to be followed for a few years only. This brings us to the consideration of the length of service of the members of the teaching body, and we will now turn from examining normal schools as feeders of the teaching body and canvass the professional character of that body.

EXPERIENCE OF TEACHING CORPS.

Although not possessing statistics for the whole country in respect to the length of service of the teachers, the educational antecedents of the teaching corps of the several States, and the vacancies that occur annually, we have found a few statements on these matters which we will bring together here, speaking first of the length of service.

In Pennsylvania, exclusive of Philadelphia, the number of teachers having taught for five annual terms is 8,370, nearly 40 in every hundred of the teaching force; in New Jersey the proportion is 55 in every hundred; in New Hampshire 1,582 schools were taught by the same teacher for two successive terms, about 51 in the hundred; in Minnesota 727 teachers had taught in the same district for three years or more, about 10 in the hundred. And now, having exhausted our supply of statistics on this point, we turn to the professionally prepared element of the teaching corps.

NORMAL ELEMENT IN TEACHING CORPS.

We have a sufficient number of cases in which statistics on this point are at hand to tabulate them. In considering the table, the exceptional character of the showing made by Massachusetts is very apparent, and the inquiry is at once suggested whether the professional character of her teaching force is to be attributed to two other features of her system; namely, the great fullness of her term, and the high salary she pays her teachers, this State being among the foremost as to the first and the foremost as to the second feature.

State.	Percentage of—		State.	Percentage of—	
	Normal School Graduates.	Those having attended Normal School.		Normal School Graduates.	Those having attended Normal School.
For 1887-88:			For 1885-86:		
California.....	20	Connecticut (1886-87).....	(13)
Minnesota.....	8	18	Kansas.....	4
Wisconsin.....	(17)	Maine.....	10
Michigan.....	2	17	Massachusetts (1886-87).....	25	31
Texas (estimated).....	11	New York.....	(4)
Pennsylvania.....	8	18	Rhode Island.....	(26)
New Hampshire.....	12	West Virginia.....	(23)
Vermont.....	10	14	Arizona.....	(9)

In examining the material for the year we have found several statements as to the institutions at which the members of the teaching force received their education, and as it is in line with our remarks we insert them:

Of the 3,996 teachers of Vermont 3,092 report the character of the institution in which they passed "the last year of their preparation for teaching" which the State superintendent classifies thus—

	Percent.
In colleges in the State.....	35 }
In colleges in other States.....	49 }
In academies in the State.....	1,179 }
In academies of other States.....	162 }
In high schools in the State.....	652 }
In high schools of other States.....	82 }
In normal schools in the State.....	451 }
In normal schools of other States.....	61 }
In district schools.....	439 }

In Pennsylvania the proportion is as follows:

	Percent.
Graduates of normal schools.....	1,716.....08
Attended normal schools.....	3,651.....18
Graduates of colleges.....	233.....01
Educated in secondary schools.....	5,719.....23
Educated in common schools.....	9,630.....45
Total reporting, excluding Philadelphia.....	20,329

The school committee of Johnston, R. I., give a list of the schools at which their teachers have been educated, as follows:

Rhode Island State Normal School.....	17
Providence High School.....	9
Friends' School, Providence.....	2
Massachusetts State Normal School.....	1
High School, Cambridge, Mass.....	1
High School, Dennis, Mass.....	1
High School, Oswego, N. Y.....	1
Noire Dame Academy, Worcester, Mass.....	1
Lapham Institute, North Scituate, R. I.....	1
Plain Farm Grammar, Johnston, R. I.....	1
Mount Pleasant Academy, Providence, R. I.....	1
Brown University, Providence, R. I.....	1
Total.....	37

It has been their aim, the Johnston committee say, to secure, as far as possible, teachers from the State Normal School.

At Newport, R. I., of the fifteen or sixteen teachers employed during the year but five or six have had professional training.

BEGINNERS.

We have now arrived at the last topic of the discussion upon which we have entered. Perhaps, in view of the foregoing statistics, it is not too bold to say that between ten and twenty per cent. of the teaching corps of the country are at least tinctured with professional ideas, and we come to consider how many more of such or their betters are required annually.

During the last year the Connecticut State Normal School graduated sixty-two pupils, all of whom are teaching. These, says the State superintendent, have supplied one-sixth of the beginners for the year in the State. It follows, then, that the beginners number about 372 in Connecticut; that, is about 6 per cent. of the teaching force.

The State superintendent of New Jersey gives statistics of the "number who have been teaching one year or less." As his report ends August 31, it is evident that the "year or less must have begun in the fall of the preceding year or at some subsequent date, provided the experience was continuous, which under the circumstances we unhesitatingly assume. The 431 teachers of this class are therefore beginners; the whole number reporting length of service was 3,919 (about 100 less than the whole number employed); that is, 11 per cent. were beginners. In Michigan during 1887, 14 per cent. of the teaching force had been licensed without previous experience in teaching. In Pennsylvania the "number who have had no previous experience" as teachers was 3,112, exclusive of Philadelphia; that is, about 15 per cent. of the teachers in county and district schools.

The State superintendent of West Virginia gives it as his opinion that one-fourth of the teaching force of his State has to be renewed annually, and the city superintendent of Minneapolis, in urging the establishment of a city normal school, calls attention to the

lesser permanency of service there than in eastern cities. In Iowa, about thirty in every hundred teachers were beginners (3,946 totally without experience, 3,671 less than a year's).

Investigations of this kind, even when as unpretentious as this, seem a waste if not leading to some positive conclusion, and when such a conclusion is avowedly stated as a conjecture from insufficient facts rather than as a fact, it would appear better to avoid "pusillanimously passing it by," as Mr. Spencer says in his book on education. Under such circumstances, it appears to us that there is a demand for as many professionally trained teachers as the normal schools have put permanently in the field, from the standpoint of the present, during the fifty years of their existence.¹

PUBLIC NORMAL SCHOOLS.

Attendance.—By the summary, given below, of the statistics of Table 32, 32,314 pupils are shown to be in 133 schools; these are not all under training as teachers, however. In "teachers' training classes" were enrolled 17,319 pupils, distributed among 112 schools. Rejecting from the total attendance (32,314) at these schools the number attending the schools not reporting teachers' training classes or pupils attending them, we find that of the 26,113 attending schools where the training course for teachers exists, 17,316 are in that course and 8,797 are not. How far the 8,800 are "model school," "practise school," or "training school" pupils, we can not positively say, but it is our belief that the request that scholars to be practised on and pupils below high-school grade be kept distinct, has been complied with, and that the full statistics of Table 32 show it. To state the matter in a less precise way, one-third of the pupils attending normal schools are not reported in teachers' training classes.

It must be borne in mind that we are now speaking of the so-called public normals, a class founded on the very obvious feature of receiving aid from public funds to the amount of five hundred dollars or more, and that this has caused schools to be included that perhaps make the statistics on their face give some confirmation of the general statements as to the non-professional character of this class of schools.

Considering the total enrolment in the schools, we find 69 per cent. of it composed of females; considering the enrolment in the teachers' training course, we find a slight increase of the disproportion, the percentage of females being 70. Though it is quite true that all the schools are not represented, it will be remembered that we are given a proportion, and that if it be of value it will hold with but slight variation though all the non-reporting schools were represented.

Instructors.—The instructors, 1,189 in all, are also unevenly divided between the sexes, but the disproportion is not so great, being 42 to 58 in the hundred in favor of women. This inequality does not appear confined to any particular section of the country; but it is uniform and large in the New England and Middle States, including the neighboring States of Ohio and Maryland.

As compared with the statistics of the preceding year, there is an apparent gain of a thousand in the total number of pupils enrolled, and a slight decrease in the number of instructors.

¹It is interesting to compare this conclusion with that arrived at by Mr. S. H. White, principal of the city normal school of Peoria, Ill., as given in his paper, read before the American Normal Association in 1870. This writer, in the course of his remarks, says:

"According to the report of the State superintendent of common schools of Pennsylvania * * * 30 per cent. of the teachers of that State are new to the work each year. The opinion of other State superintendents have been asked upon this point. So far as they have been expressed they are that from 10 to 50 per cent. of the teachers in their respective States are annually supplied from those who have had no experience. It is probably safe to say that, taking all sections of the country into consideration, this number would be about 40 per cent."

Graduates from these schools have been spoken of above. For the year under review they number 4,381, an increase of 825 over the preceding year, as far as reported. By sections the number is distributed as follows:

	Graduates for 1887-88.	From Beginning.
North Atlantic Division.....	2,334	34,083
South Atlantic Division.....	265	2,805
South Central Division.....	359	2,313
North Central Division.....	1,096	12,229
Western Division.....	277	2,025
Total.....	4,381	53,455

Permanent funds and income.—The inquiry as to permanent funds and the interest derived therefrom has produced but meagre results. In some cases it appears that the question was not understood in the usual way. In ten instances a fund has been reported, in two of these, however, merely as so much land. As far as reported, these funds amount to \$1,858,204, \$1,642,562 of which are reported by the States of the northern Mississippi Valley and \$1,300,000 of this by the State of Wisconsin. The income derived from these funds is about \$50,000.

Tuition.—The charge for tuition to persons preparing to teach, and promising to teach in the State after graduation, is nothing. Exceptions to this statement appear in Table 32, but they are only apparent. In the first place, the charge of ten dollars or less is almost always in the form of an incidental fee, and in this way also is the twenty dollars charged at the Missouri schools to be accounted for. At the Southern Illinois Normal University students pledging themselves to teach in the State are instructed free of charge for tuition, and at the Virginia Normal and Collegiate Institute fifty State students are instructed under similar conditions. At the Vermont school each town is entitled to one scholarship or more, each scholarship paying one tuition of \$24. Pennsylvania, which appears most to contradict the statement, has a rather unique way of giving free instruction, which obtains in this way: To a student over seventeen signing a declaration that he intends to teach in the common schools of the State fifty cents a week (half the charge for tuition) is given, and to each student who shall graduate and sign an agreement to teach in the common schools of the State two full years, fifty dollars. Thus, during a session of forty weeks, though the charge for tuition is forty dollars, the student is paid twenty dollars by the State, and this deficit is more than offset by the fifty he receives at the end of two years' study. The charge to non-resident normal students and to others need not detain us, and we will proceed to consider the

Average annual cost of board and lodging.—The usual averaging process will not avail here. We must use other means, and that which has been adopted is the grouping of the amounts falling within a maximum and a minimum limit. The limits adopted are these: Instances where the annual cost is \$75 or under down to \$50, where it is \$100 or under to \$75, \$125 or under, \$150 or under, \$175 or under, etc. In eleven cases the annual cost of board and lodging is reported at amounts varying with the school, from \$50 to \$75; in fourteen cases the cost varies with the several institutions from \$80 to \$100; in twenty-six cases it varies from \$100 to \$125; in twenty-three cases from \$130 to \$150; in six cases from \$155 to \$175, and in eight cases from \$189 to \$200.

As the cost when \$100 or under to \$75 is with an exception almost the higher amount, the \$75 to \$100 group may be combined with that containing the cases falling within \$100 and \$126, and the new group thus formed will constitute 46 per cent. of amounts reported. Combining this group with that containing amounts of \$150 and under down to \$125, it appears that nearly three-fourths of the answers to the inquiry as to the average annual cost of board and lodging fall about or between \$100 and \$150.

Receipts.—The total receipts of the schools classed as public normal are \$1,671,761,¹ several city schools not reporting. Of this very nearly \$200,000 were derived from the incidental fees, pupils not entitled to free tuition, and the amount—more than half of the whole—derived from tuition charges at the Pennsylvania schools, of whose peculiar manner of financial procedure in the way of State aid of pupils we have spoken above. The amount received during the year from public funds was \$1,240,197 and from "other sources" \$96,431. The discrepancy of \$135,000 between the sum of these several amounts and the sum total received has been occasioned by the failure in some cases to answer the inquiry as to aid from "other sources." In cases where it has been answered, however, it is doubtful whether tuition fees or benefactions received have not been given. These items, however, though of interest, are of little importance. In a table of public normal schools the aid from the public is the main feature.

Between the amount received from the public funds for the present year and that granted in the preceding there is a difference of about \$100,000, when the schools not reporting in both years have been excluded. In Pennsylvania there has been an increase of \$30,000. In Dakota and Michigan there have been decreases, respectively, of \$40,000 and \$60,000.

But this is not the proper way to compare these statistics. Periods greater than one year must be taken to ascertain the drift of educational things. We will on this occasion go back for five years when the appropriation was \$1,071,520; but as this included an extraordinary appropriation of \$120,000 for the Virginia Normal and Collegiate Institute, which reports this year, as it has ever since 1883-84, an appropriation of \$20,000, we find ourselves warranted in throwing out from the sum appropriated then the overplus of \$100,000. Thus reduced the sum appropriated for 1883-84 is \$971,520, leaving a gain in the five years interval of \$269,000.

¹ Not including \$15,000 of schools reporting last year but not this.

STATISTICS OF PRIVATE NORMAL SCHOOLS.

In examining the summary of the statistics of public normal schools we found that 66 per cent. of the enrolment of schools reporting students in a teachers' training course were in such course. Applying the same methods here we find that 50 per cent. of the enrolment are in such a course. Should the statistics of two schools—neither reporting this year but reporting in a somewhat different form very large enrolment in "normal classes" for 1886-87—be excluded from the divisor and dividend used in obtaining this percentage, it appears that about 31 per cent. of the total attendance of the private normal schools reporting a teachers' training course are pursuing such course. In brief, about one-third of the pupils in private normal schools are under training as teachers.

There is another feature, the male element preponderates both in the teaching corps and the attendance, and without exception as far as the totals indicate.

These institutions seem more numerous in the States of the Central and Upper Mississippi Valley, thirty of them, including that in West Virginia, being situated in this area. In the Southern States there are nine, in California one, in Pennsylvania one. Of students below the high school grade there are eighteen hundred and eighty-six, the sexes being about equally represented.

Graduates, tuition, etc.—As far as reported 219 pupils were graduated during the year; the volumes in the libraries numbered 32,843, and the value of property, including apparatus, was \$1,231,103. The productive funds amount in all to \$145,500, belonging, with one exception, to schools in the Southern States. The income from these funds amounts to \$9,200.

The charge for tuition is not high, ranging from \$25 to \$50, generally between \$30 and \$40, though in several cases falling so low as \$8 or \$9, and even \$6. Boarding and lodging in the most cases fall about or between \$75 or \$100 rarely exceeding \$150.

The total amount received by these schools from all sources was \$175,602, of which \$97,877 are specifically given as tuition fees, and \$26,157 from other sources. The amount derived through gifts and bequests was \$20,320.

KINDERGARTEN TRAINING SCHOOLS.

In examining each peculiar kind of education it is ever found that one of the most important impediments to its early progress was a want of teachers. Pupils are abundantly present; that almost anything will do for a school-house is annually complained of, but that there is a decided lack of *teachers* is but too evident. When the form of education is not commonplace, as in kindergarten or manual training work, it is difficult to get even makeshifts, and the particular form of education is retarded by having poor teachers or no teachers.

Mrs. Kriege's kindergarten training school was the first of its kind. We are under the impression that it was a training school properly so called. Since that date, 1868, many schools or classes have been established, some of them no doubt being formed to familiarize the pupils with the practical operations of the work rather than to inculcate Froebelian principles as a theory giving such activity a meaning. What a candidate for a kindergarten teacher's certificate is expected to be acquainted with in Philadelphia will be shown by the following examination papers for September, 1887:

Theory and practice of the kindergarten.—(1) State the principles which distinguish Froebel's philosophy of education from the systems of other educational reformers; (2) Describe the second gift, and explain what is intended to be accomplished by it; (3) What are the specific objects which the kindergarten seeks to attain in the education and train-

ing of the child? (4) *Weaving*, one example showing the first five steps; (5) *Pease work*, make a pentagonal prism; (6) *Paper cutting and mounting*, invent and make a geometric pattern with colored papers; (7) *Paper folding*, make the first fundamental form five times, and then convert all of these but one into four different forms.

Drawing.—(1) Make an outline drawing of a cat, of a lily; (2) Draw an outline representation of the group of models placed in view; (3) Make a picture to illustrate a story of which the following is a synopsis: Mary lived in a pretty house in the country. She took her slate and started off for school. She saw a rabbit near the lane as she went along. The rabbit sat up to look at Mary and she stopped to look at the rabbit.

Modelling in clay.—(1) How would you prepare dry clay for the children to work with? (2) How would you take care of the clay? (3) Develop the square pyramid, beginning with the sphere; (4) Model a basket containing apples; (5) Make a high relief model of a pear.

Geometric forms.—(1) Classify triangles according to their sides and their angles, illustrate with figures; (2) Classify four-sided figures, illustrate; (3) Explain the development of the cone; (4) Make a paper form of a cube; (5) Make a paper form of a triangular prism; (6) Make a paper form of a square pyramid.

Music.—(1) Why is music made an essential feature of kindergarten instruction? (2) How would you prevent children from straining their voices? (3) How would you secure a pure, sweet tone in singing? (4) Write, on the staff, three measures of music in the key of A $\frac{1}{2}$ time, using a half note in the first, a dotted note in the second, and a quarter rest in the third; (5) Write, on the staff, the major scale of B flat; (6) Sing at sight, exercise A; (7) exercise B; (8) from memory a kindergarten action song.

Plant and animal life.—(1) What peculiarities of structure are used as the basis of the classification of plants? Illustrate your answer by classifying the pink; (2) Illustrate by drawings the several parts of a flower; combine these several parts to represent the entire flower, and name the flower that you have drawn; (3) Write the outlines of a lesson on the *potato* to a class of kindergarten children; (4) Name the four great divisions into which naturalists have divided the animal kingdom, state the leading characters of each; (5) Name three different coverings of animals, and show how these coverings are adapted to the habits of the several animals to which they belong; (6) Give a conversation lesson on the *cat*, stating the distinguishing characteristics of the structure and the habits of the family to which it belongs.

Physical phenomena of nature.—(1) Write out the topics of a conversation on snow, showing the subject-matter and the purpose of the lesson; (2) Arrange the outlines of a class lesson on rocks, adapted to advanced kindergarten pupils; (3) How would you develop a lesson on running waters so as to explain their origin and their uses? (4) Write the outlines of a conversation lesson on light.

School hygiene.—(1) Give the three essentials of any scheme of artificial ventilation; (2) How can the teacher care for the eyes of the pupils? (3) How can the moral nature of the pupils be effectively aroused and strengthened by agencies at the disposal of the teacher? (4) Why do not the feelings of teacher or pupils form a good means of judging of the correct temperature of a room? What do the best authorities consider the proper temperature? (5) How can the kindergarten teacher influence her pupils in regard to their food?

Mental and moral science in their relation to education.—(1) Discuss the relative values of mental development and mental acquisition; (2) What is meant by training a faculty? Name the special senses in the order of their knowledge-giving power; state what stimuli are appropriate to each; (4) Upon what two conditions does the power to reproduce an object or event some time after it has been presented depend? (5) Show how imagination is related to the acquisition of knowledge; (6) Discuss sympathy as an element in education, its uses, how cultivated; (7) Mention some of the ways by which a child's attention is stimulated.

History of education.—(1) Write a comparison of the methods and aims of education as practised in Sparta and in Athens; (2) What was the condition of education in the Middle Ages? (3) Explain the rise of humanism and its influence upon modern education; (4) Give some account of the educational theories of Comenius; (5) Discuss briefly the educational theories set forth in Rousseau's *Emile*; (6) Give a short statement of the practical principles introduced into the school by Pestalozzi, and the bearing of these upon the subsequent development of educational methods; (7) State the leading principles of Spencer's philosophy of education.

Unfortunately we have not the data to make a comparison of the courses of the schools and classes in our table with the course of an institution giving the highly professional instruction which the Philadelphia examination papers assume that the candidate has had. Most frequently the course is of a year, and in that time it is doubtful if a student could acquire the attainments required at Philadelphia unless the process was one of refreshing or particularizing knowledge already acquired and digested.

Kindergarten instruction in normal schools.—In these schools the kindergarten has lately made its appearance. To endeavor to ascertain to what extent such instruction was being given to the intending teacher, the inquiry "Number receiving special training for kindergartens" was made. In fifteen instances a reply has been made by inserting the number in the blank space left for the purpose. In one case the answer is, "None special, but 44 receive," and in another case, "Kindergarten instruction in primary classes." As far as reported, the number receiving instruction in kindergarten methods is 841.

NOTES FROM VARIOUS SOURCES AS TO THE CONDITION OF NORMAL SCHOOLS AND OTHER INSTRUMENTALITIES FOR IMPROVING THE TEACHING BODY IN THEORY AND PRACTICE.

ALABAMA.

The new institution for training teachers established at Troy during the year for white pupils has fully gotten under way. Its object, says the organic act, is to educate teachers for the public schools of Alabama; its aims are as follows: (1) to give thorough and systematic instruction in the branches usually taught in common schools; (2) to add such other branches of general culture as will increase the knowledge of students and inspire them with a love of learning and a zeal for teaching; (3) to direct their observation and afford them such practice in teaching as will help them to acquire a mastery of the theory of teaching and skill in its practice; (4) to form, as far as possible, correct habits—physical, mental, and moral.

The building is of brick, and well furnished with the latest and most approved apparatus and appliances. To obtain admission, applicants must be at least fifteen years of age and have passed a creditable examination in the studies of the grammar grade. The examination is intended rather to bring out the student's intellectual capacity than to ascertain the quantity of his learning. Upon entering, the pupil signs a pledge, whereby he obligates himself to teach in the public schools of Alabama for at least two years. He (or she) can only be released from this obligation by paying the tuition fees that, if not entering into the obligation, he would have been compelled to pay. There are no dormitories connected with the school.

The courses of study are two: one of a single year, purely professional, for graduates of high schools and colleges and for teachers of more than one year's experience who are able to pass the examination for a first-grade certificate; the other, a course of three years, in which technical studies are not considered, at least specifically, until the second year. This three years' course, not considering the technical studies, is academic; Latin is required, French and German optional. Students completing the course will be granted the diploma of the school, which, by law, is a life certificate to teach in the schools of the State. Drawing is taught free of charge to intending teachers. The public school of the town affords opportunities for practice to the pupils. It is understood that two years have been added to the course, making it equal in course to a college.

The school in Greene County, for which provision was recently made by the Legislature, has not been established, by reason of the failure of the people of the county to provide the building required by the act.

At the State Normal School at Florence it is reported that more work of a professional character is being done than ever before. The principal also remarks that

"The demand for young men as teachers far exceeds the supply. * * * Some steps should be taken to induce young men to take normal training, as they are wanted in small towns and rural districts, while young ladies are wanted in city graded schools." The Alabama Normal College for girls receives \$2,000 annually from the State to pay for the tuition of normal pupils and \$500 to purchase school appliances. The teachers' training courses are two; one of two years and the other of four. The normal pupils pursue the studies of the college curriculum, receiving instruction in methods during the last year of their course. Those that have completed the two years' course receive a certificate to teach in the schools of the State, those completing the four-years' course receive the degree of normal and literary graduate. This school and the Tuskegee State Normal and Industrial School have been included in the table of public normals, inasmuch as they are both recipients of State aid, though not wholly State institutions.

Of private schools for training teachers the only event of note is the change in name of the school at Huntsville from Rust Normal to Central Alabama Normal Institute.

In his report to the trustees of the Peabody Fund Superintendent Palmer remarks: "Trained teachers are indispensable for any public school system, and I am glad to be able to report that the normal schools of the State each year are doing more and more training of teachers. The demand for normally trained teachers is increasing, causing a corresponding increase in the patronage of our normal schools, and the territory from which this patronage is drawn should be extended over the entire State."

Institutes.—It is estimated by the same authority that perhaps one thousand teachers attended the twenty-one teachers' institutes held during the year. The conductors of these institutes were all teachers experienced in the work. A full report of these meetings can not be had until the publication of the superintendent's annual report.

The appropriation from the Peabody Fund was \$3,000 for the seven normal schools, the Florence school obtaining over a third of the whole. For teachers' institutes \$1,000 were appropriated, which, with the \$500 appropriated by the State, were used in defraying the expenses of the twenty-one institutes above mentioned, one for county superintendents, eleven for white teachers, and nine for colored teachers.

Teachers' meeting.—The Alabama Educational Association was called to order by State Superintendent Palmer on the 26th of June last, at Bessemer. In his annual address, the presiding officer, after congratulating the association on its increase in numbers and its growing usefulness, remarked: "This seems to be an age of constantly increasing associations, caused, no doubt, by our rapidly multiplying population, industries, and commerce. In law, we have the State Bar Association; in physic, the Medical Association. * * * I might go on enumerating various associations, all having laudable objects in view. * * * It seems that those engaged in the different professions and pursuits of life have banded themselves together to become more proficient in their profession and to render their business more profitable. No profession is more worthy of encouragement than that of the teacher, and none more susceptible of improvement by association. By means of our association the ethics of the profession has been improved and given increased emphasis; young and timid teachers have been encouraged, others have had pointed out to them better methods of instruction and school management, which they have used with profit. * * * This association, then, should be encouraged, and its meetings more generally attended, as one of the means of increasing the available means of increasing the efficiency of those teachers who desire to improve, and of driving out of the profession those who can not or will not improve." The committee appointed on the Alabama Teachers' Home, located at Monteagle, Tenn., made the following report:

"Believing that some place of rest, social, intellectual, and religious improvement to be an important factor in the educational interests of our people, and believing that the 'Alabama Teachers' Home,' located at Monteagle, Tenn., is the best opportunity of meeting this demand: Therefore,

"*Resolved*, That we, as the Educational Association of Alabama, heartily endorse the work already done by the executive committee appointed at Monteagle.

"Second. That the president of this meeting appoint a committee of three to act with the Monteagle committee.

"Third. That this committee be authorized to devise whatever means they may deem best, the other committee agreeing thereto, for the completion of said Home."

The amount subscribed by the members of the association for the Home was \$250. The meeting adjourned on the 29th.

The Alabama Teachers' Home, above referred to, is the result of a suggestion made by Miss Julia Tutwiler, of the Alabama Normal School for Girls, four years ago. The Monteagle Sunday School Association has donated three lots to the association having the matter in charge. These are on the east side of the grounds at Monteagle, Tenn., a village delightfully situated on the Cumberland plateau. To the three lots thus ob-

tained Mr. Peebles, the secretary and treasurer of the Home, added another, making a front of two hundred feet. On this property three buildings are to be erected, one of which has just been completed, and is somewhat in the Italian villa style, so much in vogue about thirty years ago, but without the campanile. This is not a home for those so unfortunate as to have survived their usefulness, but a place of recuperation and rest, it would appear—"a place of recreation and profit to Alabama teachers."

ARKANSAS.

The branch normal college of the Arkansas Industrial University reports a new dormitory building now being erected at an expense of \$5,000. In the absence of the State report the only items that the Office has been able to obtain are from the report of the agent of the Peabody Fund, from which it appears that \$2,000 were paid for the support of ten scholars at the Peabody Normal College, at Nashville, Tenn., and \$1,500 for institutes in the State.

CALIFORNIA.

At the State Normal School at Los Angeles a year of graduate work has been added. This is designed to fit graduates for the requirements of grammar school teaching, and it is hoped that a sufficient number of those who have already taken the three years' course will form a class of at least ten for 1888-89. The professional studies of this additional course are psychology in the first term, philosophy of education in the second, methods in the third. The library of this school is large, and its section of "philosophy and education" consists of one hundred and ten volumes dealing practically or theoretically with the profession of teaching. "Some seven or eight of our students," says the principal, "have, after graduating, entered the State University at Berkeley to prepare for higher teaching."

At the school at San José a graduate course of a year has also been provided. Another important change made is the division of the yearly course into three terms; formerly there were but two.

The building for the Chico school has not been completed; the school will be opened in the fall of 1889.

The normal department of the Girls' High School of San Francisco is intended mainly to prepare primary teachers for the city schools; the number of pupils is limited to sixty for the coming year, including the graduates of the Girls' High School who obtained a percentage of 75 or over in the final examination.

The laws relating to the State normal schools, as amended, to take effect July 1, 1887, briefly referred to in the Report for 1886-87, are as follows:

The normal schools at San José and at Los Angeles, and any normal school established after the 1st day of January, 1887, by the State, shall be known as State normal schools, and shall each have a board of trustees, constituted as follows: The Governor and State Superintendent of Public Instruction shall be members of each board, and there shall be five members, whose term of office shall be five years, who shall be appointed by the Governor: *Provided*, That the trustees in the State Normal School in office June 30, 1887, shall hold office until the end of the terms for which they were appointed: *Provided*, That no appointment made after the approval of this act shall be for a term of more than five years, and the trustees in office when this act takes effect shall become members of the board of trustees of the normal school located nearest to their residences, and the members of any board of trustees, when first appointed and organized, shall classify themselves so that the term of one trustee shall expire annually.

The State normal schools have for their objects the education of teachers for the public schools of this State.

The State normal schools shall be under the management and control of boards of trustees.

The powers and duties of each board of trustees are as follows:

To elect a secretary, who shall receive such salary, not to exceed \$150 per annum, as may be allowed by the board. To prescribe rules for their own government, and for the government of the school. To prescribe rules for the reports of officers and teachers of the school, and for visiting other schools and institutes. To provide for the purchase of school apparatus, furniture, stationery, and text-books for the use of the pupils. To establish and maintain training or model schools, and require the pupils of the normal school to teach and instruct classes therein. To elect a principal and other necessary teachers, fix their salaries, and prescribe their duties. To issue diplomas of graduation upon the recommendation of the faculty of the school. To control and expend all moneys appropriated for the support and maintenance of the school, and all money received from tuition or from donations. (In no event shall any moneys appropriated for

the support of the school, or received from tuition or donations, be paid or used for compensation or travelling expenses of the trustees of the school, except when attending the joint meetings provided for by section 1492 of the political code of the State of California, and each trustee attending such meetings shall receive the same mileage as is allowed by law to members of the Legislature, for not more than two meetings in each school year.) To cause a record of all their proceedings to be kept, which shall be open to public inspection at the school. To keep open to public inspection an account of receipts and expenditures. To annually report to the Governor a statement of all their transactions, and of all matters pertaining to the school. To transmit with such report a copy of the principal teacher's annual report. To revoke any diploma by them granted, on receiving satisfactory evidence that the holder thereof is addicted to drunkenness, is guilty of gross immorality, or is reputedly dishonest in his dealings: *Provided*, That such person shall have at least thirty days' previous notice of such contemplated action, and shall, if he asks it, be heard in his own defence.

Each board of trustees must hold two regular meetings in each year, and may hold special meetings at the call of the secretary, when directed by the chairman. The time and place of regular meetings must be fixed by the by-laws of the board. The secretary must give written notice of the time and place of special meetings to each member of the board. Joint meetings of the boards of trustees of the State normal schools shall be held at least once in each school year, alternately, at the different State normal schools. The first meeting shall be held at San José, and thereafter at the other normal schools in the order of their organization. At such meetings the trustees shall have the power, and it shall be their duty: To prescribe a uniform series of text-books for use in the State normal schools (the State series of text-books shall be used, when published, in the grades and classes for which they are adapted); and to prescribe a uniform course of study, and time, and standard for graduation from the State normal schools.

Every person admitted as a pupil to the normal school course must be of good moral character, of sixteen years of age, or of that class of persons who, if of proper age, would be admitted in the public schools of this State without restriction.

Teachers holding State certificates of the first or second grades may be admitted from the State at large. Persons resident of another State may be admitted upon letters of recommendation from the Governor, or superintendent of schools thereof. Every person making application for admission as a pupil to the normal school must, at the time of making such application, file with the principal of the school a declaration that he enters the school to fit himself for teaching, and that it is his intention to engage in teaching in the public schools of this State, or in the State or Territory where the applicant resides.

The principal of each State normal school must make a detailed annual report to the board of trustees, with a catalogue of the pupils, and such other particulars as the board may require or he may think useful. He must also attend county institutes, and lecture before them on subjects relating to public schools and the profession of teaching.

The board of trustees of each State normal school, upon the recommendation of the faculty, may issue to those pupils who worthily complete the full course of study and training prescribed, diplomas of graduation. To each pupil receiving this diploma, and thereafter teaching successfully in the public schools of this State for three years, and to each pupil who worthily completes the post-graduate course, the State board of education shall grant an educational diploma.

The board of trustees, or such trustees as attend the joint meetings, shall have power to appoint a secretary, who shall receive such compensation, not to exceed twenty dollars for each joint meeting, as the trustees present at the meeting may order paid. The secretary shall keep a full record of all the proceedings of the joint meetings of the trustees, and shall notify the secretary of each board of trustees of any changes made in the course of study or the text-books to be adopted in the State normal schools.

The superintendent of public instruction must visit the school from time to time, inquire into its condition and management, enforce the rules and regulations made by the board, require such reports as he deems proper from the teachers of the school, and exercise a general supervision over the same.

Each order upon the Comptroller of State by the board of trustees of a State normal school must be signed by the president of the board, and countersigned by the secretary. Upon presentation of the order aforesaid, signed and countersigned as aforesaid, the Comptroller of State must draw his warrant upon the State treasurer in favor of the board of trustees for any moneys, or any part thereof, appropriated and set apart for the support of the normal school, and the treasurer must pay such warrants on presentation.

Teachers' institutes.—The law provides for county institutes in all counties having twenty districts or more, for not less than three or more than five days. The State superintendent thinks these limits should be increased to five and ten days, respectively. He calls for the enforcement of the law requiring the teachers to attend and thinks they should be notified of the part they are expected to take in advance that they may have

time to prepare. Twenty per cent. of the teachers in the public schools of the State are graduates from normal schools, and for the other four-fifths this institute instruction is valuable. The county superintendents and county boards of education in nearly all counties consider it as unprofessional conduct on the part of teachers to absent themselves from the institutes, and in a few cases have even gone so far as to revoke certificates for non-attendance. In 1888, 632 more teachers attended institutes than in 1887. The expense for institutes of the forty counties holding them was \$4,456.

Prof. C. H. McGrew, occupying the chair of educational psychology, science, and art of teaching at the University of the Pacific, observes in a comprehensive article on "A Normal Institute System for California:" "During the last two years as an instructor and conductor in some sixteen different institutes, and an observer of the work in many others, I have had an excellent chance to see the work and judge of its efficiency. I shall speak frankly of some of the most obvious defects and abuses of the (county) system. I would prefer to speak of its merits.

"(1) The average time, about three days, is entirely too short to do much good. If the whole time were given to it, not even one subject could be taken up thoroughly, much less from six to ten. Think of considering a whole science in its professional aspects in forty minutes! The institute scarcely gets in readiness to work when it has to adjourn. So the session is little more than a formal gathering.

"(2) The institute is made, four times out of five, a parliamentary body. It should be a professional school, with the county superintendent as manager. * * * I can not see the necessity of electing all the resident ministers and physicians vice-presidents. * * * Much valuable time is often wasted in this way.

"(3) The crude, unpractical, and unprofessional methods of work adopted. After a programme has been prepared for the session it is not an uncommon thing to see all sorts of motions entertained and discussed, proposing to do something entirely outside of the work and aims of a teacher's institute."

Annual joint convention of the boards of trustees of normal schools.—This meeting was held at Los Angeles, April 9, 1888, each of the three schools being represented. The report of the special committee to which had been referred the matter of preparing a uniform course of study and a uniform series of text-books for use in the normal schools proposed that each school year be divided into three terms, the first to commence the first Tuesday in September and to continue sixteen weeks, to be followed by a vacation of two weeks, and two other terms, to continue for twelve weeks each. After some discussion and dissent the report was adopted. The changes in the courses of the normal schools above noted seem to be pursuant to this action.

Teachers' associations.—The California Teachers' Association began its twenty-first annual session at Berkeley, December 27, 1887, and continued in session four days. On the second day of the session, the first being taken up with organization, the association separated into its four sections—high school, grammar school, ungraded, and primary. With two exceptions the Office has no information as to the papers except their several titles,¹ the exceptions are Professor McGrew's paper on "A Normal Institute System for California," quoted in part above, and Professor Le Conte's paper on "Sense Training and Hand Training in the Schools,"¹ both papers, by request of the members of the association, having been published in the Pacific Education Journal.

"As a nation," said Professor McGrew, "we are free to develop our institutions according to our inclinations, conceptions, and circumstances, * * * To meet our wealth of mind and character and diversified wants, schools representing almost every interest and aim have sprung into existence in our most progressive States. The most important of these to our nation and civilization are the normal and professional training schools, fitting teachers to teach the children of our public schools. This is an age of specialties. * * * Teachers, above all other skilled and professional persons, must be fitted and trained for the profession of all professions—teaching. To create as well as to supply a demand for better prepared and specially trained teachers, our normal schools have sprung into existence within the last forty years. Every State in the Union has one or more such schools. These schools have done something, but not all they could and should have done. I must kindly say, yet frankly, that many of them are normal schools only in name, for in their work and results they do not differ materially from the high school or academy. They have developed but few of the normal or professional features, yet they have done much good in giving us better academically prepared teachers with a sprinkling of professional training. The graduates may be divided into two classes,—those who have tendencies and aspirations for more professional knowledge and skill, and those who have a self-sufficiency and conceit almost unbearable. * * *

"Chairs in the science and art of education are now being established in our better colleges and universities throughout the country. * * * In my judgment our State university could benefit the public schools so much and secure a hold on them and the

¹ See Chapter XV.

people which are to support it in no other way so well as to establish such a chair and fill it with an able and practical teacher."

"California," continues the professor, "needs a normal institute system. * * * We need a four weeks' normal institute system, making the county and county superintendency prominent factors, with the law so constructed that two or more sparsely populated counties may unite to hold a union institute. * * * Our normal institutes should be short-term professional training schools, held during the summer and winter vacations. A professional course of study of three or four years should be prepared by the State superintendent or State board, and should be general, definite, and so flexible that it can be adjusted to the varying conditions and needs in the different counties, and at the same time secure a sufficient degree of uniformity. * * * It should provide for a completion of the course by teachers, and some legal recognition of such work by authorities, thus stimulating attendance and forming a class of teachers for our common schools. Model classes in kindergarten and primary teaching, and other grades, should be maintained free to the children in the town where the institute is held, thus furnishing the best illustrations of the new methods."

The professor would not compel the teachers to pay for these institutes, as in some States, nor have attendance made compulsory, but would offer as an inducement at least two weeks of school time to attend. Examining the pecuniary side of the question, Mr. McGrew observes: "Let us make a very economical estimate. Take \$500, the amount allowed for the smallest school in the country. This will enable the county superintendent * * * to hold a good four weeks' normal institute. A good conductor ought to be secured for the session for \$250 or \$300, and a good assistant for \$150, thus allowing from \$50 to \$100 for incidentals."

Speaking of the advantages to follow from a normal institute system, the speaker concluded thus: "Many of our teachers are laboring under educational and social disadvantages little felt in many parts of the East. I know from observation what many have to endure from isolating social starvation and lack of interest and sympathy on the part of others. Nothing will ever succeed in rendering the simple profession of the district teacher as attractive as it is useful. Society can not make a sufficient return to those who are earnestly devoted to this work. There is no fortune to be won, there is scarcely a reputation to be acquired in discharging their laborious duties. Destined to see their lives pass away in monotonous toil, often to encounter the injustice and ingratitude of ignorance and prejudice, they must become disheartened and succumb if they do not draw their strength and courage from other sources than a pecuniary reward and personal ambition. They must be constantly sustained and animated by a profound sense of the moral and social importance of their calling; the noble thought and feeling that they are quietly contributing to the intellectual and moral worth of the State and nation must be their highest reward. * * * Such teachers need our help. They need guidance, light, inspection, enthusiasm, and sympathy. Let California establish a normal institute system for this worthy purpose, and in five years we will have the finest equipped army of teachers in the Union."

COLORADO.

In the March, 1888, number of the Colorado School Journal the people of Arvada, Jefferson County, are said to be making active exertions to have the State normal school located at that place. Already the citizens "have subscribed about \$1,400 in cash and over 100 acres in land," and the county was to be asked to subscribe \$5,000. "It is proposed to get everything in shape * * * and go before the next Legislature with strong backing, and ask that body to pass a bill creating the school, and an appropriation therefor."

Institutes.—During August, 1887, the first institute district (the State is divided into six) held its meeting at Fort Collins for two weeks. This was the first district to profit by the new provision of the school law whereby a union of individual, county, and State funds was made possible. A number of meetings were announced for July and August, 1888.

Teachers' associations.—The State association held its thirteenth annual session on December 27, 1887, with an attendance much larger than usual. The first day of the session was devoted to addresses on manual training, and the president's annual address. In his remarks Mr. Remington, the president of the association, said that very few boards of trustees have any settled or well-defined policy. As a rule they represent not their constituents, the people, but those whom they themselves have constituted the teachers. "The teacher," Mr. Remington continues, "is a positive force. He, as an individual, knows what he wants, how he desires to work; he makes plans. The people are passive. They want good schools and are willing to pay for them, but as to what constitutes a

good school, or even upon what principles its foundation should rest, nothing is fixed, nothing is settled."

On the third day of the meeting the county superintendents' section was held, and a series of resolutions adopted by the association, of which the first is as follows:

"We endorse the central idea of the president's address, which emphasizes the need of a more intelligent appreciation of the functions and purposes of the public school on the part of the general public, and which urges teachers to strive to come into a closer and more sympathetic relation with parents."

The Office has record of meetings of the teachers of Boulder, Custer, Jefferson, Logan, and Mesa Counties.

CONNECTICUT.

The Connecticut Normal and Training School has completed the thirty-sixth year of its existence. "Its history," says the State superintendent, "has been most honorable, and what it has accomplished for its students and through them for the children and schools of this State has been in the past recognized and appreciated. Never were the demands for its graduates so urgent and numerous, and never was the prospect for usefulness so bright. * * * The graduates of the year 1887, numbering sixty-two, constituted the largest class that has ever been sent out. All of them are teaching, and thus in one year the school has supplied about one-sixth of all the beginners in the State. * * *

"As has been stated, there is a constantly increasing demand for teachers from this school and they teach with satisfaction to parents as well as with delight to children. This is an important gain because it indicates that the training has not put them out of tune with the sentiment of intelligent people. It might be expected that persons especially trained for a particular work would have narrow notions and perhaps a period of overweening conceit and self-sufficiency. If this is true, it does not come to our knowledge, and if it exists probably soon gives way, and the real effect of their instruction is apparent."

The gymnasium has been finished and an instructor in physical training employed. The course so far has been eminently successful.

The city superintendent of New Haven reports that, to provide sufficient practice for the pupils of the Welch School during the second half of the year of training, schools in two other buildings will be used hereafter for this purpose. The superintendent suggests that it would be better if one teacher at a time were assigned to give instruction, and that the regular teacher of that room should be competent to set an example of good teaching and to aid and advise the novice. The Cedar Street School is, in the language of the city superintendent, "the headquarters for substitute teachers;" the pupils, all being graduates of the Welch School, are sent out to fill temporary vacancies, working under the direction of the principal. The lack of regular teachers, a want from which this school has been suffering, has at last been overcome.

Institutes.—The number of teachers' meetings held during the year was twenty-one, with an attendance of forty-three. A summer school for teachers was to be opened at Niantic the first week in July and continue two weeks.

Teachers' associations.—The forty-first annual meeting of the Connecticut State Teachers' Association was held at Hartford, October 13-15. The Eastern Connecticut Teachers' Association met at Willimantic, November 11, 1887.

DAKOTA.

From the report for 1886-88 of the Territorial board of education, we obtain the following information:

The Territorial board of education has no control over the normal schools of the Territory except as to the course of study they are to pursue; but they think that in view of their position a few remarks on them will not be indicative of a desire to overstep the sphere of their duty. It gives them pleasure to state that radical changes have been made in the general administration of these schools, especially at the Madison school. These changes have been in the direction of professional training and of a gradual widening of Territorial influence, in contradistinction to the local character of officers and teachers and attendance in the past. Though not all that they should be, these schools challenge comparison with the best schools of the North-west. A member of their board, also a member of the board of visitors to the school of Madison, speaks in high terms of the instruction given at that school and of its conditions. The school at Spearfish has completed the new building, and most constantly gratifying reports are received from it. The need of an additional school for northern Dakota is pointed out and urged as necessary to complete the system.

In our last Report we spoke of the provisions for normal instruction in private schools and colleges. These departments are conducted under the following regulations:

Each school so designated shall adopt the course of study for its normal department that is prescribed by the Territorial board of education, and the principal of that department and all its teachers be approved by the board. Nor shall any free normal class be taught by a person not a graduate of a college or normal school in good standing.

The board reserves the right to prescribe the qualifications for admission to the free normal classes, and the questions for any or all examinations, and may at any time hold special ones.

No free normal class shall have more than twenty-five or contain fewer than ten pupils. All pupils admitted to such classes shall be accorded the same privileges as to lectures, libraries, dormitories, etc., as are enjoyed by other classes of the institution.

No tuition is to be charged other than that paid by the Territory, nor will the Territory allow a charge for a pupil attending for a shorter period than ten weeks.

Each school accepting this appointment binds itself to designate one member of its faculty as principal of the normal department, whose first and most important duty is to teach the classes of the department and supervise his assistants, if any. He may teach other classes of the institution, "if his time permits," and pupils of other classes pursuing the same studies as those of the normal class may be admitted therein. The principal must keep a record of attendance, standing, etc., and make an annual report to the board of education.

Should, in the opinion of the board, the school not do satisfactory work or violate the agreement, the board may withdraw the pupils at the expiration of a notice served three months before.

The faculty may require the normal pupils to conform to the rules of the institution, and may advertise the special department in any way they please to increase its attendance.

The board of education reserves the privilege of granting diplomas to such pupils as complete the normal class course of study.

The conditions of admission are (1) that the pupil be seventeen years of age, of good character, and declare it is his purpose to fit himself for teaching; (2) that the candidate pass an examination in the studies of the public school if not a graduate thereof or the holder of a certificate to teach in any of the counties of Dakota.

The statistics of these classes are given here rather than in connection with the main body, inasmuch as the report arrived too late to incorporate them there. The table of the Territorial report is reproduced.

The Office has information that in September, 1889, the Norwegian Evangelical Lutheran Synod of America will open a school under the name of the "Lutheran Normal School" at Sioux Falls, for the specific purpose of training teachers of either sex for the public schools and for the parochial schools of the synod.

Institutes.—The department of public instruction intends to arrange two courses of institutes a year, deeming that the experience of the Territory and the States show that an institute of one week in duration is better than one of two weeks. The courses are to occur during the fall (September to December) and the spring (March to June), respectively. In every county the department will appoint a conductor and an assistant if the county funds will admit of it, and county superintendents are requested not to employ more than two instructors. Twenty-five dollars are to be appropriated from the Territorial treasury for each week the institute continues.

The objects of the institute are to help the majority of teachers, especially the country teacher. The institute "is not a school," and academic instruction is not of the first importance. The teacher is expected to have acquired the matter; it is the method that he requires. In brief, the object is (1) to increase efficiency by giving (a) a distinct idea of the ends of education, (b) elementary knowledge of education as a science of teaching, (c) instruction in methods; (2) to secure greater uniformity (a) by discussion, (b) by professional co-operation; and (3) to correct prevailing errors.

In a later circular (1888) the department thanks the county superintendents and teachers for their support in carrying out its plan, and conductors and superintendents are advised to confine their work mainly to reading, arithmetic, language, physiology, and methods of teaching. The object of each lesson in drawing, which is also advised, is, first, to show its value; and, second, as the only available means at present to train eye and mind; "it will be the first step towards manual training."

The number of fall institutes was eighty-six, including twenty either not having an institute or not reporting. In the counties reporting there were 3,781 teachers, of whom 2,832 (not including 43 of Turner County, which did not report number of teachers) attended an institute; about 75 per cent. The meetings were also attended by 297 school officers.

Eighty-five counties were to hold institutes during the spring of 1888, of whom twenty-seven, if holding one, did not report. In the counties reporting there were 3,494 teachers, of whom 2,621 attended; about 75 per cent. At these meetings 276 school officers were present.

The cost of the fall course was \$4,874; of the spring course, \$4,480, a per capita in each case of about \$1.70.

Teachers' meeting.—The Educational Association of South Dakota met at Huron, December 21 to 23, 1887-88. Of this meeting Superintendent Patterson, of Huron, says that, though small, it was the best in results ever held in Dakota. High school matters, as well as professional, appear largely to have occupied the attention of the meeting. The constitution of the association was amended in such a way to put the body under the direction of a council of twenty-one teachers.

FLORIDA.

The course of the normal department of the recently established school at De Funiak Springs is of two years, each of two terms. No foreign language is taught, and nothing of algebra or geometry until the second year. Drawing, pedagogy, and methods of teaching appear throughout the entire course. "Our basis of classification is arithmetic," says the principal, "and the advancement of the student in this branch will be carefully considered in the entrance examination. We therefore deem it well to state here specifically that the applicant should possess a good practical knowledge of arithmetic through the principles of percentage, and the application of these principles to simple interest."

Teachers who desire to take the course of the school may complete it by attending three months each year, if they can not remain longer, and on completing the course thus taken by sections a diploma will be given to them of the same character as that given to graduates that have followed the course continuously.

The work at the State Normal School for colored is reported as wholly preparatory. *Institutes* were held in thirteen counties, during a period of sixteen weeks. At each meeting a number of teachers from other counties were present. The work was carried on under the direction of a board of inspectors of five members.

The principal instructor in his report remarks of their work: "While the attendance as a whole was not what we had hoped it would be, yet viewed in connection with the many extenuating circumstances we have reason to feel satisfied with it. * * * We were pleased to notice the increased favor with which institute work is now received by the teachers of the State. * * * In addition to this sentiment on the part of the teachers we find that the citizens generally are disposed to foster our work and to lend us the encouragement of their presence. This latter fact can not but result in good, for the trustees and patrons by attending these institutes will better understand what a teacher's qualifications should be, and in this way it will come that only true merit will be recognized. As to the usefulness of these institutes in our school system there can be no question. In the first place, there are many persons engaged in school work who have received no special preparation for it, and whose means are too limited to permit them to attend a training school. These teachers receive in the institutes suggestions on the most approved methods of instruction and are thus enabled to incorporate them in their work. In the second place, by this means a uniformity in school-room work is secured throughout the State. * * * And lastly, but most important perhaps, these meetings attract attention to the schools and thereby stimulate that interest in education which is so much to be desired, and which could not be accomplished so well in any other way." The cost of the institutes was \$1,588.

GEORGIA.

"There are, strictly speaking," says Superintendent Slaton, of Atlanta, "no normal schools in Atlanta or the State of Georgia. We have a meeting of the teachers of our city schools every week to discuss methods, etc., and this is known as a 'teacher's normal class.'" In his last report the same gentleman speaks of the meetings thus: "A general meeting of all teachers is held the first Saturday in each month. At this meeting institute work is done and the teachers are paid their salaries for the month previous. Essays on educational subjects are read by teachers previously appointed from the class; lectures are delivered by distinguished men not connected with the schools; and ques-

tions pertaining to methods of teaching and discipline are freely discussed. The three remaining Saturdays are occupied respectively by teachers of the high schools, of the grammar grades, and of the primary grades. In these meetings regular lessons taught in the respective departments are recited, and methods of teaching them freely discussed. Too much stress can not be given to the importance of these normal class meetings. The best teachers are most punctual in attendance on them, and it is an evidence of weakness for the teacher to dislike or shun them. The meetings are held in the high school building from 9 to 11 o'clock on Saturday morning."

In his seventh annual report the superintendent of Americus, Ga., speaks of the weekly meetings of the teachers of that city, under his direction, the white teachers meeting one week, the colored the next. "The first year of my superintendency," says the superintendent, "I explained and illustrated methods of teaching, having reference chiefly to the work of the primary departments. The second year the teachers discussed English grammar in all its aspects. This last year arithmetic was studied and discussed theoretically as well as practically. Lessons are assigned to the teachers to prepare at home, and these lessons are rehearsed by them before the superintendent, in which he makes suggestions, or comments on defects in teaching or discipline which he may have noticed during the interval of two weeks preceding the meeting."

At Augusta the normal classes for white and colored teachers have met regularly, as provided by the regulations. The superintendent makes the lectures practical and beneficial. During the year the class was engaged with language teaching and school hygiene. Not only was the attendance of the public school teachers regular and prompt, but a number of teachers in the private schools of the city joined the classes, and several who were desirous of qualifying themselves for positions in the public schools.

At Columbus each teacher is required in turn to prepare an essay on some subject connected with school work, the subject being selected two weeks in advance and the class discussing the paper. Speaking of these meetings during the year, the superintendent remarks: "I think the teachers will sustain me when I say these weekly exercises were productive of great good."

Institutes.—The State superintendent reports a State institute at Salt Springs, at which the attendance was about one hundred. In addition to this a series of institutes for colored teachers was held in an important part of the colored belt of the State.

ILLINOIS.

The city superintendent of Aurora has general charge of the normal training class of that city. He is aided by the principals and teachers in an endeavor to give the members the best practical course of training for the profession of teaching that can be given within the limit of one school year. Three distinct lines of work are followed: (1) A course of study including branches taught in the schools and also methods of instruction or theory of teaching; (2) a course of reading under the direction of the superintendent; (3) practical work in the school-room a portion of each day in the different grades, under the direct supervision of experienced teachers. To accomplish the first of these the class spends an hour daily with the superintendent, from 9.30 to 10.30 A. M. The results of the course of reading are shown by an essay each month, read to the members of the class, by whom it is discussed and kindly criticised. To obtain experience—the third line of work—members of the class are assigned to different rooms, where they have opportunity to observe good models of instruction, to act as assistants in supervising the silent work of pupils and in correcting papers, and to put theory into practice by teaching classes of boys and girls. The members of the class are also called upon to act as substitutes, and are expected to attend the teachers' meetings, of which there are two each week, one general and the other a special meeting of primary teachers to consider primary work. The course of study covers the studies of the common schools. The course of reading is on pedagogy, theory and practice of teaching, etc. It is assumed that those who enter the class have already attained sufficient proficiency to obtain a second-grade certificate.

Speaking of "our supply of teachers," the city superintendent of Belleville remarks: "Not only natural aptitude for teaching, but also extensive scholarship are necessary equipments for the teacher who would be successful in his calling. * * * Some of the young ladies who graduated from our own schools have succeeded well as teachers, yet * * * it is very desirable that after graduating they should acquire greater maturity of judgment, and that they should pursue their studies for several years at some State normal school. * * * Young ladies who have thus prepared themselves for their work should be elected in preference to those who have neglected this preparation."

At Quincy the teachers convened once in each month during the year. At these meetings papers were read and discussed on methods, order, etc., classes being in attendance

to illustrate methods of instruction. "The meetings," says the superintendent, "were generally full of interest and useful to the teachers."

Institutes.—It is believed that an institute is held in each county of the State annually, usually during July or August, and lasting, on the average, about ten or fifteen days. Thus a list of one hundred and one county institutes, to be held during the summer of 1888, is published in the Illinois School Journal for June, 1888. The conferences held by the State superintendent from May 4 to 22 were attended by about eighty county superintendents. At these meetings, held at various places, the syllabus for institutes received considerable attention. This syllabus was prepared by the State superintendent and a committee of the State Association of County Superintendents. The heavy orders for it, ranging from one hundred to four hundred, would seem to indicate a general desire to use it. It is more particularly referred to, page 383.

Teachers' meetings.—The Southern Illinois Teachers' Association convened at Chester, August 23, 1887. Among the features of the meeting was the public graduating exercises of about sixty persons who had completed the work of the Reading Circle. Resolutions were adopted urging teachers to join the Reading Circle, that the county superintendency be divorced from politics, and that the township be the geographical unit of the school system.

The thirty-fourth annual meeting of the State Teachers' Association was called to order December 28, 1887. The committee appointed to report upon the president's annual address recommended the following points as worthy of special consideration: As the object of the public schools is to make honest, intelligent, and upright citizens, the State has the right to demand this, and teachers should be alive to all improvements in their profession that will foster it; the county superintendency should be open only to those who have attained to "eminent success in the teaching profession," and the office should be removed as far as possible from politics; the course in country schools should be uniform; the teacher's tenure of office should be for three years; school districts should have the same boundaries as the township; and finally, that district and normal institutes should be held during the summer vacation, and that they have a special department devoted to work that will aid the teachers in the country schools. A department of higher education was established, the work of the State Reading Circle endorsed, and all efforts to teach the correct through incorrect, syntax through false syntax disapproved. The association made quite a point of the last. The language used is "that no false syntax, either written or spoken, should be allowed to exert its influence on eye or ear." The meeting lasted two days.

The association of county superintendents held its annual meeting also on the 28th of December. In the morning session a discussion of the new institute law showed that different views were held as to its value. In the afternoon session the institute question was again up, under the caption, "State Organization of Institute Work," the essayist insisting that the county superintendents should conduct his institute. In another paper a uniform course of study for institutes was advocated, and those who attended them divided into two classes—those of large experience and good scholarship, whose work in the institute should be largely professional, and those of feeble scholarship and little experience, who should be trained in methods and be subject to regular school-room discipline both as to order and study.

It was recommended by the association: That the district conferences of State superintendent with county superintendents be continued; that no one be employed as conductor or instructor in institutes who does not present documentary evidence of his approval as such conductor or instructor by the State superintendent, and that there should be an immediate revision of the syllabus of instruction prepared some time ago for the guidance in the work of county institutes. The session was closed with "the most important question that could command their attention," A Better Organization of the Educational Forces in the Rural Schools. About one-half of the county superintendents were in attendance. The editor of the Illinois School Journal, though commenting rather caustically on the proceedings of the association at this meeting, acknowledges that "the action taken looking to the improvement of the county institute is alone worth the time and expense of the meeting."

The Central Illinois Teachers' Association held its fourth annual meeting at Galesburg, March 16 and 17, 1888. The spring meeting of the Northern Illinois Teachers' Association, held at Sterling, April 27 and 28, 1888, was well attended; the association appointed a committee to investigate and to report upon the teaching of English in secondary schools. This committee has sent out a blank entitled, "Report on the Study of English in the High School," to about three hundred schools, asking that it be filled and returned.

Besides these associations many others exist in this State; county associations of teachers abound, and there is an association of State principals, and finally a school-masters', and, established within the last few months, a school-mistresses' club. The

purpose of the schoolmasters' club is the discussion and advancement of education in the State of Illinois. The methods of investigation will be informal. "There will be no display of oratory nor of rhetoric, and woe will betide the man who undertakes it. * * * The club is organized for the discovery of truth. * * * It is in no sense a 'mutual admiration society,' but proposes to sift every deliverance to the bottom." Superintendent Butler, of Beardstown, who is favorably disposed towards manual training in the school (see his report, Chapter XV) was the target for questions at the second meeting, held at Peoria, April 14, 1888, and he acquitted himself well. "A good beginning was made towards a scientific investigation of this problem."

The first general meeting of the schoolmistresses' club was held at Bloomington on May 11, 1888, with an attendance of about fifty. The aims of the club were set forth, and at the evening session it was determined to augment the educational powers of the State by establishing a woman's state teachers' association. The call for the organization of the club was based on: (1) The necessity for increased interest in profession work among women; (2) the advantage of interchanging thought and experience among teachers in the lower grades; (3) the desirability of a more direct communication between the rank and file and the State superintendency.

INDIANA.

On the 9th of April, 1888, the State Normal School building and its entire contents were destroyed by fire. The loss from this disaster was \$225,000. About \$5,000 has been expended since for furniture, books, etc., and a new building will probably be ready for use in September, 1889. The city of Terre Haute has recognized its obligations under the law and the contract with the State to bear one-half the expense of repairing the structure, the city council appropriating \$25,000 to aid the work. Additional appropriations will be made as it advances, and it is probable that in a few months the site of the former building will be occupied by a new one in nowise less perfectly adapted to the growing needs of the institution. Until that time the Normal School is carried on in the quarters now occupied in the city high school building.

The superintendent of the Warsaw schools has a class in pedagogy, which includes five more than his full corps of teachers; nineteen in all. A teachers' reading-room has been provided, and an appropriate library is contemplated.

Teachers' Associations.—The thirty-fourth annual meeting of the State Teachers' Association was held at Indianapolis, December 28, 1887. The retiring president, in the course of his remarks, said: "Some of our best school laws have been suggested by this association. The county superintendency, the township institute, the Indiana Reading Circle, have been suggested by the association. The spirit of the profession has been uplifted by it more than any other agency I can think of. The younger members will find it in a condition of active service, and we hope they will take hold and help us along with it, and make it more and more useful as the years go by."

In his address on "Needed Changes in the School Economy of Indiana," Professor Woodburn, of Indiana University, spoke of the demand for the re-establishment of the old township libraries by reason of the activity of the Indiana Reading Circle. Since the act of 1867 the libraries have fallen into disuse and their books scattered. Provision should be made for collecting these volumes and the law establishing libraries re-enacted. Text-books should not only be uniform but free. "The free text-book system has passed the experimental stage and is now an established fact." The office of teacher and of county superintendent should not be political. The association adopted a series of resolutions calling for the re-establishment of the township libraries and a small annual tax to support them. A standing committee on "school legislation" was appointed, for the purpose of annually presenting to the Legislature matters of educational importance.

Mr. Alderson, in his article on "Educational Psychology," would divide the educators of the day into three classes—those having no adequate comprehension of their profession; those who pretend to be informed in psychology; and those who think that psychology has no connection with education. "The teacher should follow the example set by scientists, and without attempting to grasp the unknowable, push into what lies immediately before him." "The constant struggle in education," he continued, "is to help the child make the ideas in his own mind real to others. * * * At the very basis of all subjects of study lie the principles of association of ideas; in it lies the solution of the much mooted questions of pedagogy. The laws of association underlie the whole field of modern scientific psychology, and form the central figure of true educational psychology."

Superintendent Hailman, of La Porte, addressed the association on "The True Test of Excellence in a School System," the paper causing considerable discussion. In her paper on the question "Should the Teacher be an Investigator," Miss Martin, of Indianapolis, urged the association to make a special effort to encourage scientific observation and inference in the school, since it is the method of our own time.

The association passed resolutions favoring a compulsory school law, a non-partisan

administration of the school system, the establishment of a children's State reading circle, and expressed its sense of duty to increase the efficiency of the profession in the State.

The association has five sections, viz: the County School and Village Section, the High School Section, the section of Institute Instructors, the Indiana Academy of Science, and the Indiana College Association. The Institute Instructors' Section had two papers on institute work before it. The first, "Educational Science as it should be Taught in the Public Schools," may be divided into three parts, the manner of conducting an institute as a meeting, a consideration of education as a science, and the presentation of this science in the institute. For the meeting place a school-house is better than a court room, public hall, or church, which have neither the apparatus nor the "atmosphere" of a school. The meeting should begin promptly on Monday. Two instructors should be employed, and six, at most seven, daily lessons of forty minutes each is all that should be given. Certain definite lines of thought should be adopted on Monday and carried through the week, thus giving opportunity to present a series of connected lessons. It should be understood that the county institute is a professional meeting, entertainment being incidental, and that it is not a place for academical work. The professional features are the history of education, the science of education, methods of primary instruction in the various grades, school management, moral instruction, and psychology.

Education is not a science in the sense that arithmetic, algebra, etc., are sciences, for "it lacks the inherent necessity which makes these subjects pure sciences. * * * It is held that education is a science in the view that it is possible to ground all the work of the school room on rationally determined principles. The processes and all the concrete work of the school instruction, management, discipline, class manipulation, all rest on principles. These ideas, generalizations, reasons, principles, when brought together and organized into coherent form, constitute the science of education." This science considers the subjects of study in the school in three related aspects; first, the educational value of each; second, the true order of sequence among the studies of the course; and third, the methodology appropriate to the different stages of each.

As to the manner of presenting the body of educational doctrine constituting the science of education in the county institute, so that the mass of common-school teachers shall be able to grasp it and base their actual work upon it, several considerations are put forward. In the first place, a week of work in an institute is not sufficient for the purpose. The works of Locke, Rousseau, Pestalozzi and of Herbert and others must be studied to the bottom to accomplish that. Again, "the science of education does not deal with receipts, prescriptions, and rules; it sets forth ideas, general judgments, reasons, principles. It must do this in the institute; do it, to be sure, in the best way suited to the conditions existing. This is to be done by clear presentation, by frequent repetition, by numerous examples and fit illustration which lie within the observation and experience of those addressed." In conclusion, the speaker said: "If education is ever to become a profession, it must be through the principle on which it rests."

The other paper was on a "Rational Method in the County Institution," which related to method, "a way of reaching an end by an organic series of steps," as enabling the teacher, while facing the distracting and perplexing details of her work, to see the organic relations of all the parts in the process, and thus to order and direct effectively everything to one end.

The first "union meeting" of the superintendents and teachers and the Northern Indiana Teachers' Associations convened at Logansport, March 28, 29, and 30, 1888. Several resolutions were adopted recommending that the appointment and retention of teachers should be a non-political matter, indorsing the work of the Teachers' Reading Circle, and approving the formation of a Children's Reading Circle, and finally voting to consolidate the two organizations under the name of the "Northern Indiana Superintendents' and Teachers' Association," holding an annual meeting.

The eleventh annual meeting of the Southern Indiana Teachers' Association met at Columbus, April 4, 1888. The association passed resolutions approving the Children's Reading Circle, urging a non-partisan administration of school affairs, and a thorough preparation of teachers for their work. This was "one of the best, largest, and most enthusiastic meetings ever held by the association."

The seventh joint convention of Ohio and Indiana City Superintendents was held at Union City, Ind., December 15, 16, and 17. The "round-table talks" were about teachers, pupils, and courses of study.

IOWA.

A normal department, having three male and three female teachers, has just been opened in Drake University, under the supervision of an experienced teacher of many years' standing. The training school of Council Bluffs has been suspended until the completion of a large building now in course of erection.

Institutes.—The statistics printed in the Iowa Normal Monthly show that institutes were held in ninety-six counties during the year, with an attendance in eighty-eight of them of 16,407, with five hundred instructors. The editor of the same journal remarks of these meetings as follows: "During latter July and the month of August fifteen thousand Iowa teachers will meet in normal institutes, and come under the influence and teaching of experienced and excellent instructors. * * * Every teacher in attendance at the institute should make it a season of educational quickening, of renewing zeal and enthusiasm, of gaining new ideas, of getting hold of better methods and ways of work, and of acquiring a broader view of the teacher's whole business. For board, travelling expenses and tuition, and examination fees, it costs the teachers of Iowa not less than \$200,000 to attend the institutes." To each institute there were, generally speaking, five or six instructors. The subjects of study were arithmetic, geography, language, physiology, history, reading, algebra, etc., and didactics.

Teachers' associations.—The thirty-second annual meeting of the Iowa State Teachers' Association took place at Cedar Rapids, December 27, 28, 29, and 30, 1887. The enrolment was 420, the attendance fully 500. The association expressed its views in the usual form of resolutions. The subdivision of townships was pronounced an evil, and uniformity of text-books urged.

The School-Masters' Round Table of Eastern Central Iowa met at Marshalltown, October 13 and 14, 1887. The discussions of this body are all informal. The first subject considered was, "Course of Reading for High School Pupils," the outcome of which was the appointment of a committee to report to the next meeting a list of books for a course of critical and collateral reading in high schools. Concerning "Overwork in Schools," the members, consulting their experience, came to the conclusion that the charge is without foundation. The "Means of Holding Pupils in School" was considered to be special courses, if the conditions of the school permit. "What a pupil in the different grades should know or be able to do" was also discussed. The spring meeting of this body was held at Cedar Falls, April 5, 6, and 7. The assembly came to the conclusion that all random exercises should be excluded from the rhetorical exercises of the primary grades, and a definite idea be kept in view as the inculcation of a sentiment or the teaching of the facts and lessons of a life. In the grammar grades they thought that the rhetorical exercises should be conducted by societies of pupils, who should choose their own officers and programme. Elocutionary exercises for the purpose of effect they condemned, though favoring the appearance before the public of every member of a graduating class with an original exercise, an essay, or oration. Taking the topics presented in Robinson's complete arithmetic as a basis, the committee appointed to report on the omission of topics reported as follows: Give little special attention to short methods; omit circulating decimals, annual interests, savings banks, stocks, bonds, etc.; exchange, foreign and domestic; arbitration of exchange; equation of payments; averaging of accounts; allegation medial, allegation alternate; arithmetical progression; geometrical progression; similar plane figures; similar solids; gauging; metric system; present worth. "Promissory notes, partial payments, and bank discount should not be greatly emphasized, if taken at all."

A meeting of the county superintendents was held May 8 and 9, at which the subject of teachers' certificates received considerable attention.

KANSAS.

The contest between appropriations for new buildings and increasing demand for admission is well exemplified in the case of the State Normal School at Emporia. In the same report that chronicles the completion of an additional wing—erected at a cost of \$25,000 and almost doubling the size of the building—is added: "But with the increase in accommodations and the consequent ability on the part of the faculty to do more and better work comes a corresponding increase in the number of young men and women."

Of the four hundred and seventy-five students of the school that gave the information, about three hundred stated that they had had some experience as teachers in the public schools, sixty having taught five or more years and several from ten to sixteen. The class of 1888, containing forty-one members, averaged twenty-three years as to age and two years of teaching as to experience. Nothing, says the president, has done more to popularize the school than the payment of mileage. It brings the school within reach of pupils in the most distant parts of the State and still keeps the expense as low as if they lived near. He also urges that provision be made for preparing special teachers of drawing, science, reading, and language, and that manual training be introduced.

Institutes.—During the summer of 1887 the Office has record of sixty-nine institutes which were to be held, but no further information.

Teachers' associations.—The Kansas Teachers' Association convened at Topeka, December 27, 1887, and discussed a variety of subjects connected with the profession of teaching and the studies of the elementary and academic grades. Among the several resolu-

tions reported was that commending the reading circle; that expressing a "sense of the practical inequality of our present taxing system, which brings peculiar hardships in educational affairs," and asking the legislature to remedy the evil; and those urging the establishment of county high schools and the grading of rural schools. These last were adopted, though the resolution relating to county high schools created a stormy discussion.

The North-western Association met at Osborne, November 24-26, 1887. The members expressed their views in resolutions to the effect that normal institutes should be classified and graded and that the graduating system be introduced, and life certificates be granted when the course is completed; that the county be made the unit for tax levies for school purposes; that text-books be made uniform throughout a county.

The South-western Kansas Association of Teachers met at Wellington, in Thanksgiving week, with about two hundred and ninety teachers and twenty normal scholars.

The Central Kansas Teachers' Association, which had held a preliminary meeting at Lyons, March 23, 1887, perfected its organization in a later meeting at Great Bend, November 25 and 26 of the same year. Over one hundred teachers and several hundred citizens were present.

KENTUCKY.

There is no information as to the new school for colored pupils mentioned in the last report of this Office. "We want in this State," says the editor of the Educational Courant, of Louisville, "real, genuine, veritable normal schools, and can do little towards advancing the standard of professional training until we secure them. We showed some months ago what constitutes a normal school, and our article was copied in numerous papers and highly commended. The main point we made was that such a school must prepare teachers both theoretically and practically, and that a school which does not do this is no normal school at all."

"Compel the Agricultural and Mechanical College," continues the editor, "to establish a model school, and give us at least two more normal schools, one in the eastern and one in the western part of the State."

Institutes.—"We are not sure," says the above-named journal, "that every county in the State holds an institute. Who can tell us?" Consulting the pages of this periodical for 1887-88, it appears that there were at least twenty institutes, generally lasting for three or four days, and thirteen meetings of county teachers' associations, five of which were meetings of organization. Judging from the recurrence of a resolution passed at these meetings that the salaries of the teachers be paid more regularly, it may be inferred that some hardship had been experienced, which the new law has in all probability removed.

The provisions of this law are in substance as follows: Each county superintendent shall on the first Saturday in October, reckoning school months of twenty days, pay the amount due each teacher of a common school, for the month or months completed, * * * and thereafter the county superintendent shall on the first Saturday of each calendar month pay the salary due each teacher of a common school for the previous school month.

The new laws or amendments, as they are technically called, to the "common school laws," also make it the duty of county superintendents to organize and hold annually a teachers' institute "for the normal instruction, improvement, and better qualification of the teachers of the county;" the institute to last five days (previously it need last but four), and is to be held in July, August, or September. The State board is to prepare and place in the hands of the county superintendent, not later than June 1, a programme of the work of the institute and a syllabus of each subject of the common school curriculum, this programme and each syllabus to be furnished to every member of the institute. Neglect to perform these duties on the part of the county superintendent is punished by a fine of fifty dollars.

Teachers and those intending to teach during the year are required to attend the full session under penalty of having their certificates (in the case of teachers) revoked.

Teachers' meetings.—The State Teachers' Association met at Mammoth Cave, and continued in session for three days. In his address the president remarked: "Three things in the theoretical organization we have been carrying out more fully the past year than before; these three things I strongly urge upon the attention of the association, and commend to its practice:

"(1) The district organizations. There is where the work has been done most effectively, where it will continue to produce the best results. The coming together, even twice a year, of a few earnest, hopeful, working representatives from the several counties comprising a district, and the opportunity thus afforded for a comparison of conditions and experiences; for mutual support and encouragement; for devising of means to

make work more effective by making it more united—all these make the district associations most productive of helpful results.

"(2) A great weakness of the association has been and is the lack of money. But more money has been used by us in the district associations this year than in any year since I have been a member. But we have only begun. There should be in the districts some definite, well-understood means of raising money, to be used in paying the expenses of special speakers, of printing, hall rent, etc. I earnestly recommend and urge some action upon this all-important point by the present assembly.

(3) The use of the press has never been, and is not yet, as frequent or as wide-spread as it should be. There is no other means of keeping our work constantly before the people so effective as the use of the press, and especially the *country press*. Our district meetings, while powerful in their influence upon teachers, yet have very little direct influence upon the non-teaching population, because very few who are not teachers attend them. But the village or county paper is read by the very citizens whose interest we must secure—whose influence must be won to our side."

Observing that the *Courier-Journal* had called the meeting a "convention," the president said he accepted the name and would frame a platform the third plank of which was, "We demand uncompromising prohibition of politics in educational matters; favoring a thorough civil-service reform upon the basis solely of competency in filling all educational offices."

The Colored Teachers' State Association met in Richmond, July 3-5, 1888. A new feature was the introduction of institute work. The association passed several resolutions, among them one calling for Federal aid to education, another expressing satisfaction with the recent action of the Legislature as to the payment of salaries, and still another condemning a frequent change of teachers, particularly in country districts.

LOUISIANA.

Other than the reported suspension of the Peabody Normal School there are no changes or matters of importance to report of institutions.

The "act in relation to free public schools and to regulate public education," adopted during the last session of the Legislature, contains several important provisions respecting the training of teachers. The parish superintendent is permitted to assemble the teachers in an institute on the first Saturday of each month, the teachers failing to attend forfeiting one day's pay. It is further provided that other institutes may be held when authorized by the board of education, such institutes to be held between the first day of April and the first day of October, in some town centrally located. Touching the city of New Orleans, which is not subject to the parish institute law, the board of directors of the parish of Orleans may establish one or more normal schools as departments for the professional training and improvement of persons desiring to become teachers.

The State held eight Peabody scholarships during the year at the Peabody Normal College at Nashville, and two thousand dollars were given by the Peabody fund trustees for normal schools.

Institutes and educational meetings.—One thousand dollars were appropriated by the Peabody Fund trustees for institutes. Of the meetings, however, the Office has no information.

The State Educational Association held its annual meeting August 23, 24, and 25, 1887, at Shreveport. In his address the president said that one of the purposes of the meeting was to create a desire to combat ignorance, that is undermining the happiness and prosperity of the State. "Such being our purpose, let us during these two days' session act wisely and harmoniously, and let the results of this conference of good people in behalf of our children be as practical as possible. The papers that will be read have been prepared with but one view—that is, to strengthen the work already begun by enlisting more friends into active sympathy with those already in the work. We must have every man and woman actively engaged in this great work. The few have attained some success, but the many will accomplish all."

In their resolution the members indorsed national aid to education and the work of the State Normal School, saying "we specially indorse the works and aims of our State Normal School and declare that, in our judgment, it has accomplished and will accomplish great good for the cause of education; and it will be a grievous mistake and injury if the people of this State do not continue to support and encourage these institutions, not only by making ample appropriations therefor, but also by encouraging and applauding its professors and giving remunerative employment to its graduates."

In another resolution the association "indorses the education of our colored population as necessary, just, and wise;" but is convinced that the races should be instructed in separate schools, and that a school of the higher order should be established in northern Louisiana, where no institution for the training of colored teachers exists.

The second annual convention of the Louisiana Superintendents of Education met at Baton Rouge, in the early part of February, 1888. Mr. Chambers, of New Orleans, in an address upon "Some Educational Needs of Louisiana" remarked that the most vital question affecting the future of the State is education; their meeting was a proof of this. In a few days the Legislature would convene and a convention of parish superintendents was of special significance and importance. Let the convention then definitely formulate the needs of the State educational system, and unanimously and emphatically express them to the law-makers. The speaker would group the need of the State under three heads, financial, of system, and general. In short more money was needed, a better system and public sentiment, and, finally, better teachers and more "State educational institutions."

We cannot follow here this fine address in its elaboration of the three topics of discussion, but it is necessary to say that among the additional institutions required was the establishment of a colored State normal school outside of the city of New Orleans, a long recognized necessity. The matter of obtaining better qualified teachers is hard to deal with, the speaker said, the difficulty lying in the low salaries paid and the shortness of the term, but it seemed to him that it should be optional with the parish superintendent whether he should employ "fifteen first-class teachers nine months in the year, teaching in forty-five schools or employ forty-five good, bad, and indifferent teachers three months in the year in these same forty-five schools." To educate the public one column of paper in each parish should be devoted to matters touching local school interests.

The superintendents then gave an account of the work in their respective parishes and a new law to be brought before the next Legislature was gone over; section after section being discussed and accepted, amended, or rejected.

Important changes in the school law were the outcome of this meeting, making it one of the most important in large and immediate results that has occurred during the year.

MAINE.

At Biddeford the superintendent meets the teachers once a month, when the various interests of the schools are discussed and improvements suggested.

In a history of the schools of Portland, published with the report of the city school system for 1887-88, the origin of the "Training and Practice Class" is thus given:

"In his first report, February 23, 1878, Superintendent Thomas Tash recommended 'the establishment of a practice class for training graduates of the high school in methods of teaching before they enter upon their work' as teachers. Such a class was established on Spring street under the care of Miss Sarah M. Taylor as principal, in September of that year. Eight young ladies were admitted to the class, under whose instruction and charge were placed the primary classes in that school. The pupils of these classes are as well instructed as in other primary schools, at the same time eight or nine young ladies are yearly becoming well trained as teachers. In 1886, forty-eight of the female teachers in the city were graduates of the Portland practice class and their work shows the value of their training in the practice class."

The sixth annual session of the Maine Pedagogical Society was held at Augusta, December 29, 1883. The president advised more attention to manual training in the schools as a means to improvement in industrial, intellectual, and moral worth. As respects language, Professor Chapman, of Bowdoin College, said that the teacher's business is first to furnish the child a vocabulary which he can understand; next, to direct his thoughts to the laws and usages of language; then, to study it with reference to its capabilities for expressing thought, and finally to bring out the elementary principles of logic. Professional reading was treated by Principal Corthell, of Gorham, who urged that in professional reading for teachers books on physiology and psychology should be prominent. As to "What and how much teaching of science in common schools should be undertaken," Professor Harvey, of the State College, said that the observant faculties being the dominant ones in childhood, they should be especially cultivated. And as the biological sciences require no costly apparatus or large cabinets, he thought that through these sciences an interest in biological studies might be awakened and made instructive under proper teaching.

Other topics were, "Expression as a means of culture," "Educational advantages of Latin studies," "The place of the seminary in the Maine school system," and "Civics as a means of study in the line of civil government," this last aiming to have a class that is studying the government of a country personate that form of government as far as possible; hold a town-meeting after the public form and method; study postal laws till they are fairly understood; discuss congressional acts in compositions and debates, and make the subjects gone over in this way as nearly life-like as is possible.

MARYLAND.

In the report of the city superintendent of Baltimore that officer observes: "I feel it to be my duty to call your attention again to the importance of establishing a training school for teachers. * * * A school of this kind is recognized by educators to be an indispensable adjunct to a good school system, as it both trains those who are to teach in the theory and practice of teaching, and rejects those who have no aptitude for such work. * * * The cost of such a school would not be great. * * * One principal lady teacher and an assistant would be sufficient to take charge of the school at first. The salaries of the teachers, together with the cost of books and of fitting up the rooms, would be the entire expense, which, altogether, would not exceed three thousand dollars. * * * It is earnestly hoped that a school of this kind may be speedily organized upon the most economical and serviceable basis. The cost of establishing and maintaining it will be amply justified by the increased efficiency of the system, secured by providing this method of selecting as teachers those only who are well qualified in all respects for the work of instruction."

Teachers' associations are recommended by the president of the Baltimore board of school commissioners as of special value to those who are conscious of their want of experience and become discouraged unless advised and assisted by those who are familiar with their profession.

In addition to the general association, of which all teachers are entitled to become members, and which holds its monthly meetings for the consideration of matters pertaining to their professional work, there is also a "beneficial association," whose benefits are for those members who need personal attention or pecuniary aid during sickness. The object is to provide a fund for the assistance of those who cannot perform their duties, and in case of death to give a sum of money to the family of the deceased. Any teacher may become a member upon paying an initiation fee of one dollar, and an annual fee of three dollars. During the last year there were 324 members and three deaths. The amount expended for benefits for sick members was \$677, and the amounts paid to families of deceased members, \$902. Since its organization in 1877 the amount paid out by reason of sickness has been \$7,123, and on account of death, \$6,880. The association is controlled by a board of directors, who are selected from the different grades of the schools, who visit and relieve the sick, and gratuitously perform other services.

From July 17-20, 1888, the Maryland State Teachers' Association and the West Virginia Educational Association met in joint session at Mountain Lake, Md. In his address of welcome the Hon. N. W. Hoffman, of Cumberland, referring to the peculiar characteristic of the joint meeting, said: "There is, too, in this first joint meeting of these two associations a special and peculiar suggestiveness. West Virginia and Maryland are not sisters merely in the sense that they are members of that numerous and eminently respectable and respected family which constitutes the Republic of the United States of North America. Close as should be and close as is, in fact, that relationship, yet are they more nearly akin than that. They are contiguous, adjoining, neighboring States. There is, therefore, a greater difficulty, a species of elbow-kinship, so to speak, as implied in that familiar and expressive old Anglo-Saxon word neighboring. In other words, there is a sort of geographical union or territorial intermarriage in the case. * * * The introduction of the free school system into each was so nearly simultaneous and so similarly circumstanced that they may fairly be said to have been of twin birth and origin. Both are yet in their infancy, each of them numbering less than a quarter of a century of existence."

Mr. Willey, of West Virginia, after referring to the cosmopolitan character of educational work, said that there are two things that the meeting could agree upon: (1) That the battle against ignorance should be broader and bolder and more comprehensive; that we should beat down the boundaries of prejudice that environ the work of education—prejudice against physical culture, against manual culture, prejudice that would discriminate between the sexes in culture. (2) That there shall be a more generous and just compensation to the toiling, weary teacher who is in the front of the battle against ignorance.

The subject of manual training being up, one essayist would define it as meaning training the hands for future activity, and as valuable for (1) the bread-and-butter argument; (2) its educational feature; (3) its discipline; (4) its moralizing influence. Mr. Anderson, superintendent of the Wheeling city schools, objected to such training as "impossible, unpractical, distracting, and doing no good." Secretary Newell, of Maryland, in discussing the subject of free text-books, would have them as free as desk- and blackboards. Pens and ink are not free in some Maryland counties. In treating of the subject of arithmetic, one speaker maintained that there is too much arithmetic taught in the schools. In discussing the subject of county superintendency, the principal of

the Hainesville (W. Va.) schools stated that a thoroughly qualified superintendent could not be got by election.

The convention adopted a resolution appointing a committee of five to attend the meeting of the educational associations of Maryland, West Virginia, Pennsylvania, and Kentucky, and report at the next meeting of their respective associations, and inviting the above-named associations and others to send delegates in like manner to the meetings of "our association." A committee was appointed to consider the means of organizing a Maryland State Teachers' Reading Circle.

MASSACHUSETTS.

The report of the city superintendent of Fall River contains a succinct account of the development of the Teachers' Training School of that city. As it undoubtedly illustrates the genesis in other cities of schools for the same purpose, the remarks of Superintendent Connell are given somewhat fully:

"From the time of the establishment of our high school, in 1849, to that of our training school, in 1881, teachers for our schools, especially females, were almost exclusively chosen from the graduates of our high school. Before receiving an appointment they were required to pass satisfactorily an examination in the various branches they were expected to teach. No professional training was given or required of them, except for a few years, when the normal department, so called, was added to the school between the dates above mentioned. The course of study for this department consisted simply of a review of the common English branches for one year by the members of the graduating class who expected to become teachers. By this change in the course of study the committee recognized and emphasized the importance of normal or professional training for teachers. No attempt, however, was made to teach the science of education, nor was any opportunity afforded to practice the art by members of the class.

"In process of time this normal instruction in the high school was discontinued, and although the graduates were urged to take a course of training in the normal schools in the State, but few did so, after graduating, because of the additional time and expense involved.

"Teachers, however, were selected, as before, from the graduates without professional training, provided they had passed the examination required. The few who attended and graduated from normal schools, however, were given the preference on account of their larger experience and professional skill, in the appointment of teachers.

"The normal schools now established in the State come far short of supplying the demands made upon them from the different cities and towns for trained teachers, and because of this fact the larger towns and cities have very generally established "training schools" of their own in which instruction in the theory and practice of teaching is given.

"Our training school was established in 1881. Its purpose is to give the graduates of our high school and other persons of equal attainments in the city desiring to become teachers the advantages of a professional training in the science and art of teaching, so that they shall be the better fitted to discharge properly the duties of the school room. From 1881 up to June, 1887, 166 persons have entered as pupil-teachers; of these 157 have been graduated, 118 have taught in this city and other towns, and 97 are now teaching in our schools; doing excellent service for the city.

* * * * *

"Without doubt the graduates of this school make better teachers because of the training they have received than they possibly could have made without it. It should be said, however, that an element of weakness begins to show itself arising from the practice of allowing all the graduates of the high school desiring to become teachers to enter as pupil-teachers, simply because they are graduates, whether they possess the necessary physical and mental qualifications to become good teachers or not. My opinion is that we have pursued this course as long as it is wise or profitable, and in its stead I recommend that pupil-teachers enter by examination. In order further to guard our teaching force from accessions to its number of persons poorly qualified, I recommend that the graduates of the training school be required to pass a satisfactory examination before their names can be put on the list of approved candidates for the position of teacher.

"In my opinion also it would be beneficial if occasionally a teacher of marked ability could be procured from some other place to teach here in a grade in which she has manifested special strength and fitness."

Boston.—"The only school whose course of study has not been revised the past year is the normal school, but its time must soon come," says the superintendent. "When the kindergarten shall have become an organic part of our school system the need will exist for a number of well-trained kindergartners. These ought to be persons not only practically familiar with the ways of kindergartens, but also well versed in the princi-

ples of education. This last, indeed, should come first; and the future kindergartener should be, first of all, a graduate of the normal school. The special instruction to fit her for kindergarten work should be the general instruction that the normal school gives."

"This means a graduate course for kindergartens, and when this change is made, it is befitting that one long discussed the extension of the normal course from one year to a year and a half, be also made."

Cambridge.—In speaking of the rather unique experiment instituted in 1884, of devoting a school having the several grades of the public schools to the training of inexperienced persons who in other respects were properly prepared for professional work, the superintendent says that with only one or two exceptions the thirty some odd ladies trained in this way have become successful teachers, and the expectations in regard to the school in this respect have been fully realized. A doubt was entertained at the time of inaugurating the experiment whether the pupils, taught by these novices would be as well taught as those attending the other schools. This objection, however, was met by claiming that the inexperience of the young teachers would be fully compensated for by the experience of the principal of the school and his assistants, and this the results of three years' actual work have shown to be true.

Stoneham reports monthly meetings to discuss methods of teaching and discipline, to consider different ways of surmounting obstacles in the teacher's daily path, to review educational work, and otherwise promote the professional character of the teaching body. Occasionally meetings have been held devoted to the work of a particular grade, and these have been more popular and, as the school committee would say, more profitable than the general meeting in which few of the teachers can be induced to take an active part.

During the year the teachers of Athol organized for the purpose of holding teachers' meetings, several of which were held. At their last meeting for the school year the members were addressed by a member of the Bridgewater Normal School, who spoke on "Teaching of History in the Public Schools."

The Office has information concerning the meeting of teachers of Essex, Hampden, Middlesex, and Norfolk Counties. At these meetings questions of professional interest were discussed. They last for one day only.

The Martha's Vineyard Summer Institute held its annual meeting from July 16 to August 17. This institution, the oldest of the summer schools, it is believed, is chartered under the laws of Massachusetts, and has a large and commodious building of its own. The school is on a promontory that juts out into the Atlantic, rendering it a delightful place of summer residence. One of the departments, in charge of a State educational agent, is devoted to training of teachers.

Teachers' meetings.—The 43rd annual meeting of the State Teachers' Association was held in Boston, November 26, 1887. General Francis A. Walker spoke of the recent action of the Boston school committee in curtailing the study of arithmetic and explained the reasons of the action. In the first place, home lessons in arithmetic were prohibited on three accounts, the encroachment of the study upon other studies, which can not be rectified when the pupil studies at home; the inequality among the pupils as to home surroundings when pursuing a task requiring concentration of mind, and the facility with which exercises too difficult can be stopped when they are done in the school. In the second place, it was believed that much force and energy were wasted, and even injuries sustained, in carrying on the study of arithmetic as it had been conducted in many schools.

Superintendent Stone, of Springfield, spoke of the "Modification Needed in the Grammar School Curriculum." He considered that geography and history are not properly handled as studies, and would include drawing and music. Superintendent Edgerly, of Fitchburg, thought that one of the most essential modifications needed is to meet the case of children who are unable to attend school regularly. It is impossible for these children to pursue the curriculum arranged for them.

In the primary section the subject of language was up. Superintendent Aldrich, of Quincy, said that as a distinct study language has only been ten years in existence, and because of this newness a feeling of uncertainty exists as to the manner in which it should be taught. Mary J. Lovejoy, in her paper on "Light Reading," urged the importance of early instruction.

The Bay State Teachers' Club held its annual meeting at Boston, October 29, 1887. Superintendent White, of Cincinnati, in his address to the club on "What may be fairly expected of our Public Schools," said he thought the imparting knowledge common to individual men should be one of the prime features in fitting the child for coming life, and that particular attention should be paid to his behavior. The secretary of the State board, Mr. Dickinson, recommended the use and study of language, as the rational study of language is the study of man. He outlined a course of study that should be pursued in the public schools, and said it would be unfortunate to crowd into them that which is of no practical use to the scholars. Messrs. Scudder, Lambert, and Atwood spoke of the

necessity of cultivating the moral part of man, and Dr. Mayo said that the teachers should be put in more vital communication with the public, so that the people would have a clear understanding of the aims and objects of the schools, and the teachers, in turn, would become acquainted with the views of the community on the most important question of manual training.

MICHIGAN.

The State board of education, in its last report, notes the advance of the addition to the normal school building, which when completed will fully meet the demands now being made upon the school. A library building has also been provided.

Teachers' institutes.—On this important topic the superintendent, in his report for the year ending December 31, 1887, remarks:

"The value of these local professional schools has become thoroughly recognized by the teachers of the State, and the benefits that result from a regular attendance and close attention to the instruction given are unquestionable. They have come to be a necessity, especially to the teachers in the district schools. The institute affords the only opportunity that a large majority of these teachers have of informing themselves as to the latest methods of instruction that have proved successful in our best schools. A most gratifying indication of the growth of appreciation of the value of the institutes on the part of school officers is shown by the readiness with which district boards assent to closing their schools to allow the teachers to attend. A few years ago the sentiment against closing schools during the session of an institute was so strong and so general, that it was deemed inexpedient to appoint any during the term of school. This necessitated crowding all the institutes into the few weeks of vacation, rendering it possible to utilize the services of our best instructors in but few counties. This opposition is gradually disappearing, however, and now not only do boards generally comply with the request to close school during the week of the institute, but in many cases the department is requested to appoint the institute during school term to insure the attendance of the teachers."

Still using the report of the State superintendent, we find that the attendance has kept pace with the growing popularity of the institute, three-fifths of the teachers of the counties being in attendance on the institutes of the year. One of the most gratifying features of this attendance has been the increased interest in the institute manifested by the teachers who most need their aid—the teachers holding third-grade certificates. During the year 1887 nearly 60 per cent. of the attendance were of this class.

It is complained of by the conductors of the institutes that the teachers of the ungraded country schools do not understand what the institute aims to do for them. Its purpose should be made known by the secretary of the board of examiners, who now has succeeded, to some extent, to the duties of the county superintendent.

Touching the duration of the institute, the superintendent thinks that a session of two weeks is the best, since the idea of the Michigan institute is "more to suggest the method than to make an exhaustive study and application;" besides, the expense would be too great. In some counties, where the fund is large, several institutes, each of a week, have been held, with very satisfactory results.

It is found that institutes held during the school term are as fully attended as those held during vacation, while work is better. The sentiment is general among instructors that too many topics are considered.

During the year sixty-five institutes were held, with a total enrolment of 6,354, a slight decrease as compared with the previous year both in institutes and attendance. The total amount expended for the institutes during the year was \$8,954, about four-fifths of which came from the county fund, a per capita cost of \$1.40.

Teachers' meetings.—The thirty-seventh annual meeting of the Michigan State Teachers' Association was held during December 27, 28, and 29. The organization of this association is somewhat different from that of other bodies of the kind. What is good for one grade of teachers has been deemed good for all, and sections for city superintendents, grammar school teachers, and primary school teachers have not been formed. Hereafter, however, there will be a special department for primary teachers, and the organization now known as the Association of County Secretaries and Examiners will be more closely connected with the teachers' association. In the Examiners' Association the following resolutions were adopted:

• Whereas it is generally understood by the educators of Michigan that our district schools are failing to meet the demands of the present time; and

Whereas the said partial failure is due to a want of proper legal authority to organize and control said district schools: Be it therefore

Resolved, That we, the members of the Examiners' Association of the State of Michigan, in convention assembled, do request the superintendent of public instruction to

seek such legislation as shall secure the following: Township system of organization for the district school and a system of grading for district schools.

In his inaugural address President Ewing spoke of the necessity of teachers organizing themselves into an association and taking a stand in the community, and thought the university should show a livelier interest in their association, and in concluding called on the members to unite in an effort to secure the township system. Principal Sill, of the State Normal School, addressed the meeting on the topic, "To what Extent are Thought and Feeling Mutually Exclusive?" Referring to Professor Payne's three laws—(1) From aggregates to elements; (2) Mutual exclusiveness of thought and feeling; (3) Progress from the confused to the definite—he held that the first and the last are practically identical and lie at the foundation of teaching, but that the second is only true under certain conditions. In concluding, he maintained that in the vast majority of cases thought and feeling are not mutually exclusive; that this law is not true unless limited, and when limited it is useless. The paper was much discussed. In discussing the "New Education an Outgrowth of the Old," a lady essayist said that kindergarten work cannot be learned from books. It is applicable to primary and grammar schools, but cannot be engrafted in its entirety.

Superintendent White, of Cincinnati, spoke on "Universal Education the Duty of the Hour." The State has plenary power, and the cry of the child must be heard. The State should educate (1) as a means of military defense, (2) as a means of material prosperity, (3) that liberty may be perpetuated. Discussing the question of psychological instruction in high schools, it was maintained by a member that such instruction was necessary, since so many young men and women graduates from them become teachers. "The Teacher in Society" was discussed by the superintendent of Ithaca, who maintained that social intercourse was a preventive of dogmatism and narrowness, and enabled the teacher to become a positive force for good in the community.

The public school superintendents held their meeting at Lansing, on May 10 and 11. The general sentiment of the association seemed to favor a judicious enforcement of the compulsory education law, and of the truancy law also, though it was opposed to truant schools, except for large cities. The opinion was decidedly in favor of substituting calisthenics, singing, marching, "individual permission," etc., for the usual play recess. A paper on "The Relation of the Superintendent and the Teacher" provoked an animated discussion, bringing out statements that the superintendent should have five leading qualifications—knowledge of methods, education, executive ability, manliness, enthusiasm, and love for his work, and that a prominent fault among teachers was a lack of broad and accurate scholarship. The kindergarten and the manual training questions received attention and provoked opposition, both being admitted to be good things in their place, which was not in the public schools, those opposing them would say.

The Schoolmasters' Club held its annual meeting at Ann Arbor, on May 5, 1888. The work of this body was apparently devoted to secondary education. Professor Demmon, of the University, spoke of technical grammar. As grammar, as well as geography and arithmetic, is somewhat under a cloud now as an instrument of culture, the heads of the professor's remarks are given in full abstract. (1) Technical grammar is an instrument of culture in training the reason faculty in quickly and accurately interpreting language. (2) Grammatical knowledge as such is a preparation for studying foreign languages. (3) Grammatical principles are an aid in correctly speaking and writing. (4) The difficulty of the subject in some of its phases and the importance of a rational grading in presenting it are: (a) danger of trying to explain to beginners what must be incomprehensible to them; (b) of having them parse and analyze matter above their comprehension; (c) of the study degenerating into mere routine and memorizing; (d) of corrupting the English idiom through rules and manufactured false syntax; (e) dangers arising from treating etymology and syntax separately.

At the Bay View Summer Schools of 1887-88, it is said that more than one hundred teachers were enrolled in the kindergarten classes under Miss Matilda Ross on the first day of the meeting, while later on one hundred and fifty calls for good teachers in Michigan schools were received. In the art department free-hand drawing and modelling in clay were taught by Mrs. Sterling, of Chicago. Dean Wright, of Boston, lectured on New Testament Greek; Professor Winchell, on practical geological excursions; Miss L. Jones, on English literature; Professor Mills, on art; Cady, on music; Fall, on physiology and botany.

MINNESOTA.

In 1885 the Legislature provided for a new normal school at Moorhead, and in 1887 appropriated sixty thousand dollars for a building. The site, the gift of a citizen, contains six acres. The building, when completed (the school opened August 29, 1888), will be 177 feet long, 80 feet wide, and three stories in height, the entire building being

devoted to school purposes. On the first floor are the rooms for the model and the kindergarten departments. The second floor contains the president's office, the library, a reception room and four large recitation rooms. The third floor contains rooms for writing and drawing, the chemical and physical laboratories, a room for botanical work and a museum.

In discussing the subject of State Normal Schools, State Superintendent Kichle calls attention to their influence and progress. Their right to exist and their claim to support are now beyond all controversy. He calls attention to their urgent demands for increased accommodations, particularly at Mankato and St. Cloud; while at Winona better facilities should be provided for a "ladies' home" for the female pupils. Teachers' certificates, he says, need attention, and he recommends that the Legislature provide, (1) for the licensing of graduates of normal schools to teach; (2) for examining and licensing persons to teach in the State who have proper education, skill, and experience; (3) for an appeal to higher authority by the district teacher or superintendent in the matter of a teacher's qualifications, in the interest of all concerned.

Of the total number of teachers employed (7,555), 571 were graduates of a normal school and 1,427 had attended such an institution. The net increase of teachers was 269; a decrease of about one hundred in men appears, however. The increase in the hundred was in the case of normal school graduates about one, and in the case of those having attended a normal school 1.5.

The president of the normal school board of the State speaks of the schools in the following terms: "The board appointed a committee of its own members, during the past year, whose duty it was to visit and examine carefully the work, the management, and general efficiency of each of these schools; and it is the belief of the members of that committee, after visiting them, reviewing their course of study, examining their general management, witnessing their methods of instruction, and observing the actual work of the class room, that thorough and efficient work, good and healthful discipline, and a high degree of normal training is being accomplished by each of these institutions.

"Being so important a part of our magnificent system of public instruction, it is, I believe, the sense of the board that they should assume as rapidly as possible their peculiar functions as normal schools, exclusive of the preparatory and general work, which the condition and circumstances of our people make, for the present at least, an absolute necessity. * * * The board has inaugurated, during the last two years, a few changes of more or less importance, in the business management of the schools, and in the courses of study pursued, looking toward a more perfect unity of the normal school system under their control. These four normal schools constitute one system. They are not separate, independent, competing, and antagonistic institutions; but all of one system, and located in different parts of the State for the convenience and easier approach of the people. * * * It is also the opinion of the board that the diplomas of the normal school should be made a permanent license for those holding them to teach in any of the common schools of our State at least. It is also the judgment of the board of normal school directors that its numbers should be increased to nine at least."

The character of the enrolment of the schools as to previous scholastic training will be shown by the following table, the items not being necessarily mutually exclusive:

Graduates of high schools.....	64
Taught one term or more.....	353
Having first grade certificate.....	32
Having second grade certificate.....	273
Having third grade certificate.....	84
	380

At Winona the "average age" of the pupils is 19.9; at Mankato, 19, and at St. Cloud 20.8 years.

Minneapolis.—The plan for a teachers' training class, mentioned in the last Report of this Bureau, does not seem to have materialized, since the superintendent pleads eloquently in his report for 1887 for this indispensable means of providing for local educational demands. He says that the necessity for providing trained teachers has caused normal schools to be instituted in nearly every State, but that such schools are as yet unable to supply the demand. This and the desire to give a homogeneous character to their instruction have induced most of the large cities to create normal schools and classes of their own. If in older cities, where comparatively few changes occur, a training class has been thought necessary, why is not such a class still more necessary in Minneapolis, where so many new teachers are required and changes have been so frequent?

St. Paul.—Two distinct lines of effort are carried on in the teachers' training school of this city: (1) The teaching and training of the children who attend it; (2) the initiation of young teachers into the true theory of education and the application of that theory to actual school work. "The value of the professional training can be estimated only from the service which has been rendered by the graduates of this school." The

school has three departments—training, practice, and model. In these, special attention is given to the principle of teaching, government of schools, methods of school management, and history of pedagogy. It is found very necessary that the elementary branches be thoroughly reviewed. During the year substitute teaching has been a marked feature, the average of substitute work being over three weeks to each member of the class.

Institutes.—Sixty-five institutes were held during the year, having an enrolment of 4,470, a decrease of two institutes and of twenty-four in enrolment. Of these, those holding first-grade certificates number 270, those holding second-grade 2,101, and those holding third-grade 1,093, a slight increase in each instance over the preceding year.

In his report the State superintendent, speaking of teachers' institutes, says that institute instruction extends to every county in the State, and that in several counties the rule has been established that certificates are not to be granted to persons who do not attend. He recognizes the validity of the demand on the part of several counties that more than a week should be given to this work, though believing that, as a rule, one week of good work is the most serviceable. He highly commends the energy of many of the county superintendents in securing a full attendance and faithfully attending to their duties.

Teachers' meetings.—The eleventh annual session of the Minnesota Educational Association was held December 27, 28, and 29, 1887, at St. Paul, with a good attendance. President Gray, of the St. Cloud Normal School, spoke on the relation of the normal to the high schools, stating that the function of the high school was to impart knowledge; that of the normal school to confer skill in imparting knowledge. Normal schools should raise the standard of their professional work, while high schools should show their faith by sending graduates to the normal schools. Superintendent Moore, of Lake City, thought the normal school should do less academic and more professional work, and Superintendent Bechdolt showed statistically that the academic work of the normal school is less complete than in well-regulated high schools. His figures were objected to by several members as far from conclusive. Superintendent Hammond, of Madelia, spoke of the tenure of office question, holding that surety of position would not benefit the teacher so long as district suzerainty prevails. As long as the district authorities looked on all teachers, good and bad, as subject to their will, no good can come to the profession. The discussion of this paper was somewhat animated, and a committee of five was appointed to consider it and to confer with the State superintendent in regard to proposing legislation. A discussing of the subject of drawing showed that that important subject has not received the attention it deserves at the hands of school authorities.

The State association of county superintendents convened December 26, at St. Paul, and adjourned the following day. The president took for the subject of his address, "Shall the county superintendent be a politician or an educator?" The superintendent is a representative man, and to mistrust him is to mistrust the people who elect him, and the question resolves itself into "the relation of the superintendent to parties and to party politics." In a peculiar sense is the office a touchstone of public honesty and purity of judgment. "As of our teachers we ask only, 'Are they competent, are they moral, are they devoted and sympathetic?' So have we," said the president, "a right to demand that we be examined in the same way." The State superintendent spoke briefly of the prospective work of the department and of the great common school problems to be solved by county superintendents. The township question, school libraries, temperance hygiene, and the wise use of the increased school fund, to go largely to the rural districts. The township system was discussed at considerable length, and a committee appointed to consider the subject. School architecture and temperance hygiene were touched upon.

MISSISSIPPI.

The Mississippi State Normal School, which has lately been reorganized, is now under the immediate control of the State superintendent and the superintendent of Marshall County. It is the aim of this school to prepare teachers for the public schools of the State, competent not in books alone, but in all the great principles that are so necessary to make good citizens.

At Walthall a school having the title of Walthall Normal School was established in September, 1887, by a number of public-spirited citizens forming an educational joint stock company, which, with the amount subscribed for stock, quickly erected a building to accommodate the "better school" the members found themselves in need of. The school has a preparatory course, an introductory scientific of two years, and a commercial, a surveyor's, a scientific, and a classical course, each of four terms. In addition to these, there is a teachers' training course also of four terms. In the first term the study of philosophy of education is added to the common branches; in the second term mental science is added; in the third, rhetoric, algebra, physiology, English literature and methods constitute the curriculum; and in the fourth book-keeping takes the place of algebra, philosophy that of physiology, and penmanship that of methods.

Teachers' meeting.—At the teachers' meeting held at Jackson, December 23 and 29, 1887, it was recommended that examinations be held on four days in the fall and four days in the spring, instead of three days, as now; that teachers examined in one county and seeking employment in another be refused a license until their examination papers have been examined by the superintendent who appoints them; that a two years' license be granted to a first-grade teacher whose examination papers average between 90 and 95 per cent., and that the second State license, obtained at the expiration of the first, be made a professional license, valid for life, provided the teacher remains in the profession. It was also recommended that counties be empowered to employ expert institute managers, that a State normal school be established, and that chairs of pedagogy be established in the university and in the agricultural and mechanical college.

MISSOURI.

Kansas City.—The city superintendent, in speaking of the desirability of establishing a training department, observes that such a class should be formed in justice to the graduates of the high school, who, desiring to become teachers, should serve an apprenticeship before they are permitted to teach. This work should be carried on under the eye of an experienced and skillful teacher—not a watcher, but a teacher who knows how to teach and who can teach others the science of teaching provided their pupils possess any native talent.

Institutes.—The Office has information that twenty-one summer institutes were to be held at as many places, each lasting for four weeks each, and that many others were to be held, the place of meeting, however, not having been determined on.

Teachers' meetings.—During the last days of December, 1887, three of four sectional associations of the State held their annual meeting: the South-west Association at Marionville, the North-east Association at Moberly, and the Missouri Valley Association at Warrensburg. The colored State Teachers' Association held its meeting at St. Joseph, during the holidays, and the county commissioners met at Sedalia, continuing in session for two days, and adjourning to meet with the State Association at Sweet Springs in June following.

The State Teachers' Association met on June 19, 1888, and remained in session for three days. The afternoon of the first day was consumed by papers treating of psychological subjects, and the morning of the second by a discussion of the English language in the various grades of schools. The lady essayist presenting "English in the Primary Grade" would use stories in biography and in arithmetical work, begin sentence development about the fourth grade, as also the development method of teaching the various parts of speech. In presenting the subject of "English in the Grammar Grades" the essayist maintained that the child had taste for the beautiful in literature, and that it should be cultivated by bringing it into communion with the beauties and inspiring thoughts of our best writers. *Masterpieces* rather than the *lives* of authors should be studied. English in the high school, said the gentleman presenting that grade of the question, should have as much time as mathematics or the classics. To develop an appreciation of the finer shades of thought conveyed by words, their origin and meaning must be studied. Drill in composition and correct language are required, and but a few authors should be studied. In presenting the college course another essayist claimed that instruction in grammar and rhetoric often defeats the purpose contemplated. Language study is a study of the modes of thought of writers, and to obtain a perception of this a few selections should be well studied, and the pupil having caught the *modus operandi* will apply it himself on other occasions.

The afternoon session was devoted to relations—the relation of the county commissioner to country schools, of the teacher to the patron, of the State to education. The morning session of the last day was devoted to considering "The Teacher in the School" and to "The Teachers out of School." In the school, said the gentleman presenting the question, the teacher does more talking than a minister or other public speaker; a probable average is 17,500 words daily. As an agent to train pupils to search for knowledge the teacher is invaluable. Out of the schools, said the lady having charge of this side, and especially during vacation an opportunity is given to the teacher to study social life, nature, and books, all most excellent means of professional development; for the teacher who knows most about the world and its requirements is the best. The afternoon session was taken up with papers on county, city, and State supervision. The first advocated a uniform course of study, examination for promotion, normal institutes, and the reading of educational literature; the second spoke of the relation of the city superintendent to the patrons and the necessity of his studying their interests, of being the friend and adviser of the teachers, and of being thoroughly familiar with their individual work; the third spoke of the qualifications of the State superintendent and of improvements in the system of public schools.

Among the several resolutions adopted by the annual convention of county commissioners, held June 21, 1888, at Sweet Springs, were, that endorsing county supervision and entreating each county commissioner to agitate the question in institutes and in public; that asking that each commissioner prepare an outline of work and a course of study and advocate its adoption in the rural districts, and that the law respecting the effects of stimulants and narcotics be so amended that this instruction be made compulsory upon all pupils, "without a written request from parents or guardians."

MONTANA.

The Montana Territorial Institute of 1887-88 opened its session at Helena, December 27-29, with Mr. Wylie, of Roseman, president, and discussed "Language Teaching in the Public Schools," "The Work of the County Superintendent," "Music in the Schools under the Tonic-Sol-Fa method," "What Topics in Common School Arithmetic?" As to the last, Mr. Harmon, of Roseman, attacked the text-books in use, and advocated the preparation of a book that should contain the necessary matter, free from the superfluous contents that now encumber many arithmetics. Mr. C. F. Lee, of Butte, dwelt on the importance and due order of precedence of the sciences in public schools, giving place first to physical geography, and following it with natural philosophy, chemistry, geology, and astronomy. He spoke with special stress on the significance of chemistry in such a mining region as Montana, where every stage of the mining processes was founded on fundamental truths of chemistry. He advocated teaching by experiment throughout.

NEBRASKA.

The twenty-second annual meeting of the Nebraska State Teachers' Association took place at Fremont, March 27, 28, and 29. The president, in his address on the question, "Are Our Schools in Harmony with our Present Social Conditions?" observed that formerly every house was an industrial institution and its inhabitants in some capacity laborers, thus evoking forethought, judgment, ingenuity, frugality, and industry. From such social conditions has been evolved our own complicated civilization, vigorous and harmonious beyond parallel. Material conditions are powerful in determining a people's character. The schools direct the energies that have brought about these results. The schools in their evolution have developed in a line independent of other educational agencies. Hence the antagonism between them and the so-called practical in life. Manual training will remedy this opposition. We are slowly, but surely, nearing the time when the technicalities of the expression of thought will be supplanted by things calculated to develop thought itself.

In an address on "Simplifying the Work in the Country Schools," efficient teachers, the establishment of county high schools, and fewer branches in the common schools were advocated. In the paper on "The Work of the Grammar School" technical grammar was condemned, and Latin or German advocated. "An Outsider's Views of the Schools" was, that there was entirely too much nepotism, and that county superintendents were forced to leave things undone that their duty demanded; book monopolies abound, and the graded system yokes the brilliant to the dull.

The association passed the following among other resolutions: (1) That as the title of professor is properly applied only to teachers in institutions of university and college rank, the association condemns the misapplication of the title.

The college, common school, and county superintendent's section held separate meetings. In the college section it was agreed to include the academies and other preparatory schools of the State; in the common school section "two needed reforms" were suggested, a broader basis in the common school course and the adaptation of the college course to correspond with the common school, and not fix their own standards for the common schools to come up to. In the superintendent's section "Institute Work for the Coming Summer" was discussed conjointly with a "Uniform System of Text-Books in the State" with a result showing that a majority were in favor of uniformity in the county but not for the State, and that it is not desirable to furnish free text-books.

The South-eastern Association held its meeting at Beatrice, November 24 and 25, 1887, with an attendance double that of the preceding meeting.

NEVADA.

During Thanksgiving week, 1887, State Superintendent Dovey, of Nevada, conducted at Reno an institute for the teachers of the State, which is said to have been attended by more than half of such teachers, some of them coming a long way to secure the benefits of the institute; one 150 miles by stage. A State Educational Association was also organized, the first meeting to be held at Carson.

NEW HAMPSHIRE.

The State Normal School at Plymouth has received an appropriation of \$12,000, with which a new building will be erected, to relieve the overcrowded condition of the old one. As originally organized, the institution is said by the State superintendent to have been little more than an ordinary academy, with a teachers' class attached, which received special instruction and practice in school work. Teachers and patrons of other seminaries in the State protested against the authorities building up an academy at Plymouth at public expense to compete with institutions equally good. The objection was acknowledged as just, and the school became strictly professional. As a consequence, the attendance languished. Having imbibed a prejudice, people are slow to disabuse themselves of it, says the superintendent. Had the school started as a normal school prosperity would have come earlier. To prejudice against the school was added ignorance of its necessity, but experience has removed the one and enlightened the other.

Dover.—The school committeemen have selected the teachers for the city schools in most cases from the graduates of the high school, and in future they will adhere to this rule. A training school should be established without delay, where not only high school graduates, but other residents of equivalent culture, who choose teaching as a profession, may have the opportunity to secure practical instruction and training to prepare them for their duties; for a "knowledge of the human mind, and especially of the laws of development, is now justly regarded as one of the most important studies for a teacher." Teachers, they say, as well as the public, are slow to comprehend that teaching is a profession, and as such is based upon principles which it is necessary to learn to apply.

In concluding, the committee say that they cordially approve of the plan inaugurated by the teachers of supporting a pedagogical library for themselves.

Portsmouth.—In discussing the subject of pupil teachers the superintendent says that the day is past when the idea prevailed that any one can teach, especially a primary school, for it is becoming more and more recognized that a teacher should be trained before being trusted with a school. This necessity of training was recognized in Portsmouth to some extent by requiring inexperienced teachers to go about among the schools for three months to observe the methods. "There is a strong doubt in my mind," says the superintendent in a previous report, "whether this training is sufficient. Three months is a very short time in which to learn how to develop and train a human being for useful life." The system of pupil teachers is not altogether a success, he thought, since there is neither skilled oversight nor definite course of study, while the pupils consider that they are conferring instead of receiving a favor by their tours of observation.

The school established to supply the training thus called for has proved the fallacy of the only argument urged against its foundation, that the teaching could not be so good having so many inexperienced teachers practising upon the children in the school. During the year these children have advanced more rapidly in their studies, and have done their work more thoroughly than in any other school in the city. "These are facts," says the city superintendent in his last report, "and a little consideration will show that such ought to be the case, for the teachers have in recitation only small classes, and can give them much more individual attention than is possible in any other school. From this school children never go home with the plaint that *they have not recited to-day*, as sometimes happens in other schools where one teacher has to attend to fifty little ones. Then again we have at the head of the school a superior teacher, an expert, who is directly and solely responsible for the teaching throughout the whole building."

Institutes.—For forty years the value of institutes as an important factor in education life has been recognized in New Hampshire. Occasionally abused, they have ever been popular when properly conducted. The present system was established four years ago as a help in elevating the professional character of the teaching corps and awakening a public interest. The expense of attendance has been reduced to the lowest possible degree, and the best talent has been secured to conduct the work.

"Work in an institute can not all be new," says the State superintendent, whose last report we are using, "and would be less valuable if it were. * * * Much of the value of institute work is in the diversity of views presented. *AN* can not use successfully the same models." It is no loss to the schools, the superintendent thinks, for teachers to attend these meetings. "They are relieved and strengthened by an interchange of views and sympathies, and are lifted out of the ruts in which they have become accustomed to move."

During the year ten institutes were held in as many counties, having in all an attendance of 1,009, and costing \$1,775.

Teachers' meeting.—The New Hampshire State Teachers' Association held its thirty-fourth annual meeting at Nashua, October 27, 28, and 29, 1887. A paper on "Teaching

Spelling in Primary Grades," advocating teaching it by the writing and the oral method, called forth a vigorous debate. The drift of the discussion of the question, "What is the Best Course of Study for High Schools?" was toward magnifying the importance of scientific studies and the study of the mother tongue, and increasing the time given to geometry and lessening that devoted to analytical mathematics. "Do not crowd the curriculum," was the warning of both the leading speakers on the question. The subject of drawing was before the association, the essayist advocating its introduction in every public school grade. The ubiquitous question of manual training also received attention at the competent hands of Miss Fay, of Springfield, Mass.

After appointing a member to write the history of the association, resolutions were adopted (1) approving the action of the Legislature in refusing to repeal the town school system; (2) endorsing the pending bill for providing free text-books; (3) appreciative of county institutes; (4) endorsing the Blair educational bill now pending in Congress.

NEW JERSEY.

With the year ending August 31, 1887, 1,188 teachers have been graduated by the normal school during its existence of thirty-two years, of whom 26 per cent. are now teaching in the State; or, considering the number graduated during the last ten years, 477, 64 per cent., about.

Of the 3,891 teachers holding State, county, or city certificates, 12 per cent. had been granted by the State, 51 per cent. by the county, and 37 per cent. by the city school authorities. Taking the three years last past previous to the date of his report, the superintendent gives the following comparative statistics:

Grade.	County Certificates.			City Certificates.		
	1884-85.	1885-86.	1886-87.	1884-85.	1885-86.	1886-87.
	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>	<i>Per cent.</i>
First.....	18	19	20	56	67	67
Second.....	22	24	24	27	23	18
Third.....	60	57	55	17	10	15

It will be noticed how the increase from the first to the third grade in the case of the county certificates is completely reversed in the case of those of the city.

In speaking of the term of service in the same school, the superintendent remarks on the favorable result the statistics of his State will show when compared with those of other States. He gives the following statistics as indicating efficiency, "for, as in every other profession, no amount of training in theories will supply the place of actual experience in their application:"

Period covered, in Years.	Teachers in the same School.		Teachers having Experience.	
	State.	Cities.	State.	Cities.
1 or less.....	1,036	166	431	110
1 to 5.....	1,566	695	1,347	598
5 to 10.....	642	441	977	435
10 to 15.....	383	315	565	330
15 to 20.....	189	165	339	267
20 to 25.....	68	60	142	81
Over 25.....	25	34	118	64
Average.....	4½	7½	7½	9½

Commenting on these figures the superintendent says that "only about 26 per cent. of all the teachers in the State have served in the same school one year or less, about 8 per cent. have served in the same school longer than fifteen years, and about 18 per cent. have served longer than ten years." The average is three months longer than that given in his report preceding. "Less than 9 per cent. of all the teachers in the cities have been in their schools one year or less. About 54 per cent. have served longer than five years, and about 30 per cent. longer than ten years."

Paterson.—The work of the normal school was suspended from September, 1887, to January, 1888, on account of the lack of room. "There is much that needs to be done,"

says the superintendent, "to increase the efficiency of this department, and I renew my suggestion in a former report that a fully equipped practice department be developed for the use of this school, and that the school be furnished with a pedagogical reference library."

Teachers' meeting.—The thirtieth annual session of the New Jersey Teachers' Association was held at Trenton, December 28, 29, 30, 1887. The attendance was about five hundred. An exhibit, carefully graded and the second of its kind, attracted considerable attention, drawing and the work of the lower grades being especially prominent. The president, in his address, dwelt upon the need of forming habits of morality and thorough work at an age when they can be most easily fixed. The principal aim of our schools should be to form such. The time not required for this should be used in developing the powers of mind and body by educating the faculties of reason and judgment. Less explanation and more practice in early life is the prevailing thought. The child should form habits in oral and silent reading, of comprehending the thought of a sentence at a glance; also the habit of taking unconscious note of the spelling, and of hearing and retaining the pith of all discourses heard. Superintendent Poland, of Jersey City, would promote 50 per cent. of the class on their record in class and take the teacher's record as a criterion in the lower grades. Principal Griffin protested against (1) measuring a child by his answers to the pet conundrums of committeemen, (2) the idea that the vicious and idle child should be promoted because he has answered three-fourths of these conundrums, (3) the practise that a conscientious, hard-working pupil who has failed to answer three-fourths of the conundrums should not be promoted, and (4) the farce of examining first-year pupils in text-book information in order to ascertain those fit for promotion.

Principal Green, of Long Branch, after giving the result of his inquiries on manual training (q. v.), said that graduates of high schools, though prepared by normal school graduates, were not admitted to the pedagogical course of the normal schools in which their teachers had been trained until they went through the grammar school course of those normal schools. "Either the normal school does poor work or it should acknowledge the work of its own graduates."

The second day was given to the New Jersey Reading Circle, whose benefits were acknowledged. On the last day Superintendent Jacobus, of New Brunswick, under the title of "Cobwebs," spoke of that one which deemed that one primary teacher could properly instruct 79 to 140 children during the day. A second cobweb was the idea that the results of an examination show the results of instruction.

It was resolved that in the six grades of license the ages 16, 17, 18, 19, 21, and 25 be changed, respectively, to 18, 19, 20, 21, and 25; that "theory and practice" be added to the third grade county requirements; history of pedagogy to the first grade county requirements, and psychology to the third grade State requirements in the place of trigonometry. Applicants for a higher grade of license will now need to be examined only in those branches not covered by the lower license held. Pupils having diplomas of high schools in which the course of study is equivalent to that of the State normal school are to be admitted to the pedagogical or second class without further examination. The association also gave as its opinion that the school tax should be raised from four to five dollars.

NEW YORK.

The normal schools, says Superintendent Draper,¹ have never done better work than during the year 1887-88. The Empire State has nine of the best normal schools in the country. These schools are full, do good work, and send forth graduates who readily find employment. They are more and more closely confining themselves to their legitimate work of training teachers for the public schools. Yet they do not and can not supply the needs of the State for professionally-trained teachers, nor can they be increased to the extent which will serve the purposes of the State. Normal work of a lower grade, less in extent and nearer the homes of the people, must be had before the wants of the rural schools can be supplied. It is idle to think that the time and money involved in pursuing a normal school course will be given in order to obtain the miserly salary of a district school, with the probability of losing even that before a year.

Differences exist between "normal school men" and "academy men." The normal school has an academic department, the academy trains teachers. The past is responsible for the academic departments in normal schools, and to suppress such departments would be dishonorable unless a new bargain were made with the locality where the normal school is situated. But why not prevent non-residents of the locality from entering this academic department of the normal school; why not reorganize this normal "train-

¹ The Powers and Obligations of Teachers. The Work of the Last School Year. An address before the New York State Teachers' Association, July 6, 1888.

ing class" of the academy so that it will become in truth and in fact a part of a State normal system? Let the "training class" be taught by a professionally-trained teacher, and open to those only who are proficient in subject-matter and pledge themselves to teach in the public schools. The course of study should be uniform throughout the State, and when completed a teacher's certificate and not a meaningless paper should be conferred. It is perfectly feasible to do this; all that is necessary is deliberation, consultation, and agreement. But it can not be done if boards of trustees are to be permitted to hand training classes over to teachers and tell them to make what money they can out of them, or to improvise training classes for the purpose of sharing in public moneys.

The normal schools, training classes, uniform examinations, and teachers' institutes are the four instrumentalities for protecting, perfecting, and advancing the teaching service. Separately they are not very effectual, but acting together results will soon follow. Teachers must have something more than a fair education. Their essential equipment is ability to arouse interest and stimulate intellectual activity whether they teach a high school or a primary class, a city or a country school.

When the four agencies form a comprehensive and harmonious system, professional training can be obtained by those who desire to teach, and a teacher's certificate only by those who are professionally trained, a healthy revolution in the school affairs of the State.

The most important event—Superintendent Draper says "the most important movement since the establishment of the free-school system"—of the year is the adoption of a system of uniform examinations by the county commissioners.

A year ago—we again have recourse to the superintendent's address—after the act upon this subject had failed to become a law, the State association unanimously requested the school commissioners throughout the State to make application to supply them with printed question papers for use in simultaneous examinations which should be made the basis of teachers' certificates. Sixty-five of the one hundred and thirteen commissioners made the request, which was cheerfully complied with. The issue began in September, and in January, when a new set of commissioners came in, the following circular letter was addressed to the school commissioners of the State by the superintendent:

"The following regulations and forms of certificates in reference to uniform examinations for teachers' certificates are hereby established and prescribed for the guidance of school commissioners who signify their intention of conducting their examinations of candidates for commissioners' licenses under the plan and regulations outlined to go into effect January 1, 1888."

These regulations are classified under six heads, and are in brief as follows:

(1) Grades of certificates.—Teachers' certificates issued by school commissioners shall be of three grades, first, second, and third. Those of the first grade continue for five years and may be renewed without re-examination; of the second grade for two years and may only be renewed upon re-examination; of the third grade for six months and may not be issued to the same person more than twice, and must be limited to a particular grade or school.

(2) Qualifications of candidates.—As to experience, candidates for the first grade must have taught successfully for at least two years. As to educational requirements, candidates of the third grade are required to pass an oral examination in reading and a written examination in arithmetic, composition, geography, grammar, orthography, penmanship, and physiology and hygiene; for the second grade in the same and in the additional subjects of American history, civil government, current topics, and elementary drawing from copies and from objects; for the first grade, in the same as for the second grade, except reading, and in the additional studies of algebra, book-keeping, elements of physics, methods, and school law.

In examining for the third and second grades the same questions are to be asked for the same subjects, the grade being determined by the standing. The candidate for a third-grade certificate must attain at least 60 per cent. in arithmetic, geography, grammar, and orthography, and an average of at least 60 per cent. in all the rest. The candidate for the second-grade certificate must have attained 75 per cent. in arithmetic, geography, grammar, and orthography, and an average of 75 per cent. in the rest. Candidates for second-grade certificates are to be exempted from examination in any subject in which, when candidates for a third-grade certificate, they attained 75 per cent. For certificates of the first grade separate examinations are to be held. Candidates must attain at least 75 per cent. in arithmetic, geography, grammar, and orthography, and an average of 75 per cent. at least in other subjects, and are to be exempted from examination on any subject in which they have attained 75 per cent. in an examination held by the State department of education for a State certificate.

No paper that shows a standing of less than 50 per cent. is to be accepted. School commissioners may in their discretion supplement the written examinations by oral

questions, demand a higher percentage, refuse to examine a candidate, or grant him a certificate.

(3) The examinations for second and third grades are to be held in each commissioner's district on the first Saturday of January, March, April, May, September, October, and November, and on the second Tuesday of March, August, and September. Examinations for the certificates of the first grade shall begin on the second Tuesday of March and August, and continue for two days.

(4) Certificates of the first and second grade are to be valid in any commissioner's district in the State when endorsed by the school commissioner.

(5) All papers submitted by candidates are to be endorsed in ink by the school commissioner, with the standing attained and filed, subject to the order of the State superintendent.

(6) Blank certificates will be prepared and issued for the use of the commissioners by the department of public instruction.

Under date of July 17, 1888, the State superintendent again addresses the school commissioners in a circular letter in which he says:

"It is with pleasure that announcement is made that all the school commissioners of the State have adopted the system of uniform examinations. * * *

"Persons having any thought of teaching should be urged to take the examination whenever possible, even long before they stand in need of their first certificate or of the renewal of the old one. Teachers should be continually encouraged to try the examinations whenever practicable, for the purpose of gaining certificates of a higher grade than those previously held. It will be found that the regulations have been modified with a view to preventing any unnecessary repetition of examinations, and for the purpose of encouraging teachers to rise through the higher grades.

"I feel not only like expressing to the commissioners my appreciation of that commendable devotion to the public school interests which has led all of them to voluntarily enter upon this most important undertaking, but also like congratulating the people upon the successful establishment of a system which seems destined to lift up the teaching service of the State, and work a revolution in the quality of the instruction in the schools."

The act permitting the superintendent to issue certificates to a graduate of a college or university and to endorse certificates and diplomas issued in other States is given under the head of new legislation, in a preceding chapter.

Brooklyn.—"If we had to choose," says the superintendent, "between method and no method, between teachers that are methodical machines and teachers that are aimless and unmethodical, we should certainly select the former, for any plan is better than no plan. But since the establishment of the training school, to a measurable extent at least, we are relieved of the necessity of making this selection. Its graduates have been trained in sound educational doctrine as well as in sound educational method. * * * But unfortunately our training school can not turn out its graduates in sufficient number to supply the demand. Its utmost capacity is less than sixty-five graduates a year. Last year there were two hundred and five new teachers appointed, of whom only forty-five were graduates of the training school. I would, therefore, recommend that the new building on Heyward Street be organized as a second training school."

Rochester.—The plan of conducting the teachers' institute the past year has been somewhat changed. The teachers of each department, primary, intermediate, and grammar, meet on a given day, those of each grade in separate rooms, and discuss questions pertaining to their special work. These institutes proved to be so interesting and profitable that the same plan will be pursued hereafter.

Institutes.—There are no statistics of the work, but we have the authority of the State superintendent for saying that it has greatly improved, that attendance has been larger and more regular, discipline better, the work more systematic and progressive, and the institutes smaller.

It is the intention to arrange a course of institute work which shall be continuous from year to year and year after year for three or four years. By this plan annual repetition and chance will be avoided and results ensured. One of the most important steps of the year was the introduction of drawing into the work of the institute, and it is hoped to put it in all the schools by this indirect means. With the opening of the fall institutes under the supervision of the American Museum of Natural History, and in the same way which Dr. Beckman has followed in New York City and Brooklyn, it is contemplated to give the institute pupils an evening's entertainment and instruction. The scenery of the State, natural and artificial, will be shown in graphic form and talked about.

"In short," says the superintendent, "I desire it understood by the teachers of the State that I consider the institute one of the most important helps of our work, and one which should be brought to the highest degree of perfection and efficiency possible. The law exacts the attendance of all teachers outside cities, but I ask you to join with me in making the institutes worthy of your attendance, so that you will not be there be-

cause the law exacts it, but because it is well for you to be there. We have the facilities for making the model teachers' institutes of the country, and we must be satisfied with nothing less."

Teachers' meetings.—The forty-third meeting of the New York State Teachers' Association convened at Watkins, N. Y., on July 4, 1888, and remained in session three days. In his report the chairman of the "committee for increasing the efficiency of the association" referred to the attendance at Elizabethtown, which was two hundred and fifty. Few normal school teachers attended; of the one hundred and thirteen school commissioners about forty; from the colleges practically none. Other and better organized associations seemed to be drawing away from their own. He submitted that the association, like a country school, needed organization; that there was need of a permanent place of meeting and of many changes in the constitution. The constitution he proposed was adopted, and Saratoga fixed upon as a permanent place of meeting after 1889.

Superintendent Whitney, of Ogdensburg, read a paper proposing that training classes be established in each county where teachers may be trained for first-grade certificates. Several papers were read tending to show the necessity of manual training; an abstract of that by Professor Sheldon is given in Chapter XV. Superintendent Draper's address has been so largely used both in this and in a former chapter that it is not given here.

The following resolution, referring to the adoption of uniform examinations, was adopted: That we extend to Superintendent Draper and to the members of the committee appointed by this association, and to the commissioners and superintendents who have co-operated, our hearty thanks and pledge our further co-operation; we express the hope that the thirty city superintendents not yet in line with us will soon join hands with the commissioners in making the system a unit throughout the State.

The fifth annual meeting of the Council of School Superintendents of the State was held at Rochester, November 17, 1887, with about forty superintendents present. Superintendent Beattie, of Troy, in his paper on "How the compulsory school laws may be made more effective," said it was resolved as a special need that some places of detention for delinquent children, with industrial school training, ought to be established in sufficient number to meet the requirements of the case. Also, that every community ought to be required to furnish sufficient school accommodations for the entire school population, and that if the law does not warrant the appointment of truant officers it ought to be amended to provide for such appointment in all cities and important villages, with adequate compensation for the officers.

After discussing manual training in the common school system, it was resolved that such training is desirable, but to what extent could only be determined by circumstances of different localities, and that until its scope is fully defined great care should be used not to displace anything in the regular course of study that has the sanction of long usage and has met reasonably the demands of the public.

On the question, "whether examination for teachers' certificates should be made uniform throughout the State," State Superintendent Draper said that the contest over that point in the last Legislature, in which such a bill was passed, but vetoed, put new life into the discussion of school topics, and that now, in three-fourths of the commissioner districts, papers by the State department of public instruction are in use. The council unanimously approved this action, and resolved that teachers ought to be examined according to a fixed uniform standard; having entered on work should be subjected to a probation sufficient to determine their capacity to manage and direct a school; and, having passed such a probation with success, should be secure of continuance unless removed for proven cause.

At the last session of the council the committee on an industrial State public school for poor and dependent children declared their resolution to continue the effort to secure such a school.

Then, after discussion of the "basis of promotion," and "the disposition to be made of pupils that fail to meet requirements for it," "subjects and methods of discussion in teachers' meetings and associations," were presented, and other business disposed of. Utica was made the place of meeting in 1888, and Superintendent Snow, of Auburn, was chosen as president of that meeting.

The thirty-third annual meeting of the New York State Association of School Commissioners and Superintendents met at Binghamton, January 18, 1888. Mr. White, of Syracuse, in an address as president, spoke of these meetings of teachers as of great importance, and thought the law should make the time spent by the teacher in attending them no pecuniary loss to him, and that town association meetings should be held on regular school days. He favored the township system and special training for rural teachers. The principal of the Potsdam Normal School spoke of the school commissioner as a hygienic inspector. It was his duty to see that the schools, teachers, and pupils were tidy and the school-houses ventilated. The commissioner of Onondaga, in discussing "The Teachers' Institute," said that the very teachers who need their in-

struction were those who failed to attend, and he would have the certificate to teach depend upon full attendance during the five days the institute lasted. He advocated the district institute, and the publication of a complete programme. The instruction should be practical; instruction in the elementary branches, not fine-spun theories and lectures, should be given. Fully 18 per cent. of the licensed teachers failed to attend the institutes during the year. The commissioner of Broome County read a paper on "Recent School Legislation," in which a plea for the improvement of the country school was urged. Mr. Draper, in his address on the duties of the school commissioner, said that the commissioner was the one man authorized to modify the limits of school districts. His also was the duty of supervising and preventing the farce of a poor school, and to abate nuisances in the shape of buildings and outhouses. The commissioner must use all his power to promote the highest interest of public education. His full time is required, and should be given to the work.

NORTH CAROLINA.

"While we have many good teachers," says the State superintendent, "we have a much larger number of inferior ones. Many of our teachers are themselves school boys and school girls, without sufficient knowledge in books, and especially without training in school government and management, to fit them to take charge of the very important and responsible duties of teaching and governing children."

The same officer recommends the establishment of a thorough system of county institutes and examination of teachers, and that all teachers be required to attend. Also a training-school for white teachers and the abolition of the summer normal school for whites.

The school known previously as the New Berne State Normal School has changed its location, and is now known as the State Colored Normal School, at Goldsborough, N. C., whence it issues its "first annual catalogue." The State has fourteen scholarships at the Peabody Normal College at Nashville, which are all filled.

There is a pronounced demand for a normal college. The normal schools (institutes) for the whites have done great good, but a regular normal college would do more, especially if a better system of county institutes were established. Such action is to be asked of the General Assembly at its next meeting; which body, it is hoped, will adopt the plan. A start for higher training of teachers is what is needed now.

Institutes.—The State received \$750 from the Peabody Fund, which was expended on eight institutes in sums, with two exceptions, of one hundred dollars each. "Each of our normal schools (institutes) is in session annually from three to four weeks," says the State superintendent. "These schools are for instruction of white teachers. The colored people have appropriations by the State, amounting to twice as much as the appropriations to these institutes for the whites. The money for instruction of the colored people is applied at five different points, and at each point the school is in session about nine months per annum. These schools for the colored people are under the control of boards of directors, composed of white persons, and in each one there are employed as instructors three or four competent colored persons."

At the Hyde County teachers' institute it was resolved that provision should be made for the establishment of a teachers' training or State normal school, to be in session at least eight months of the year, and whose faculty during vacation should be required to conduct the institutes held in different parts of the State.

Teachers' meetings.—The fifth annual session of the North Carolina Teachers' Assembly convened June 13, 1888, in the assembly's new building at Morehead City. The first day was devoted to the dedication exercises; of the other proceedings we have no account.

There is quite a movement in educational circles for the purpose of promoting among the teachers and friends of education "social acquaintance and enjoyment, broader general information," consideration of the best methods of teaching, mutual and practical aid, etc. The name by which those associations are known is "teachers' council," and they seem to be organizing quite rapidly throughout the State. Any teacher or friend of education may become a member. The meetings are held on a Saturday once a month.

OHIO.

Numerous county institutes and teachers' meetings have been held during the year, but we have but meagre statistics; too meagre for presentation, in fact. Of the many educational associations—State, sectional, tri-county, and inter-State—held during the year, the forty-second annual session of the Ohio Teachers' Association, held at Sandusky, June 26–28, 1888, claims our attention principally. In his inaugural address Superintendent Clements, president of the superintendent's section, maintained, (1) that

people generally do value education, and, to the extent of their ability, use the means provided for the enlightenment and training of their children; (2) that they do not agree as to what makes an education valuable and practical; (3) that teachers, as well as patrons, are not agreed as to what the education value of the different subjects of study is; (4) that educators are not agreed as to the principles on which education should proceed, and hence not agreed as to the methods to be employed. Not considering the third and fourth divisions, we will give some quotations from the remarks of the speaker bearing on the first and second:

"We need no better evidence of the value put upon education in this country than the time and money devoted to it. More than seven millions of children were in daily attendance at the public schools during the present year. It is not easy to estimate the money value of the time of these children. If they had been put to work, their earnings would have gone a great way toward the support not only of themselves, but of the families to which they belong. It is quite impossible to determine the amount paid for books, clothing, and other supplies necessary to keep these children in school. The amount expended yearly by public school officers is a little more definitely known. From the most reliable information at my command I am satisfied that the value put upon common school education by the people of the United States is not less than \$250,000,000 annually. Our people are altogether too practical to make such liberal investments of time and money in enterprises that promise little or no return. They know there is value in education."

* * * * *

"Multitudes of people care little for religion, and do less for its support. Multitudes, also, have little concern for the political affairs of the country, notwithstanding they must live under the laws made by those elected to office. There are, however, comparatively few who are not deeply interested in the education of their children, and who do not make great sacrifices for its accomplishment."

As to what it is that makes education valuable the speaker said: "Notwithstanding this general appreciation of education in the minds of very many, it is not at all clear in what this value consists. There is an impression that somehow it raises one's standing in society, it helps him in business, it increases his comfort and happiness. The father says: 'I want my boy educated, so that he may not be obliged to dig for a living, as I have had to do.' The mother seeks to have her daughter educated, that she may be able to move in polite society, and, if ever she has to earn her own living, that she may do it in a more genteel way than by serving in a kitchen."

"This of course is a very low view of the case, but it goes to show that each one fixes a value upon education according to what he wishes or expects to receive from it, and not according to what true psychological and sociological principles would give to it."

* * * * *

"The word practical is applied to that which is useful in distinction from that which is ideal or theoretical. A practical education, then, is one that can be put to use in such ways as the possessor may desire. It is not simply ornamental, but is available in carrying on the business of getting a living, in the performance of our duties as citizens, and the working out of our destiny as men and women."

* * * * *

"Does the possession of a given number of facts or principles which relate to the various kinds of business in which men may engage form any considerable part of a practical education; for example, the number of quarts in a bushel, or the number of acres in a section of land? If so, it must be evident that a person's education can be made practical to him only so far as the facts he has learned can be used in his particular calling."

"We might apply this line of argument to every kind of business, and we should find that there are a few facts, principles, and laws—few in comparison with the whole number that might be known—useful in all occupations, but that each calling requires a knowledge of certain facts not useful in any other, unless very closely related to it."

"What is commonly known as mental discipline constitutes a far more potent and valuable factor in practical education than the mere acquisition of learning. It is strange that the advocates of practical education can not see this, and, on the other hand, it is exceedingly unfortunate that many of those who place a high value on discipline, place a correspondingly low value on the acquisition of knowledge for utility. If they can secure the symmetrical development of the whole mind, they seem to have accomplished their purpose, and care little whether the information acquired is useful or not."

In his paper on "Training for Citizenship in Public Schools," Dr. R. W. Stevenson said that the teacher had a twofold duty to perform, (1) "by the discipline and government of the pupils and systematic training to obedience to rightful authority, integrity, industry, acute moral sense, and patriotism;" (2) by imparting "such a knowledge of the

government, national, State, and municipal, as becomes citizens of a government whose people is the highest authority and the final court of appeal on all political questions."

The president of the association, Dr. Alston Ellis, in his inaugural address said: "When I became a member of the Ohio Teachers' Association, early in the seventies, the all-absorbing topic of discussion was the relative value of the classics and the so-called natural sciences as subjects of study. Wordy was the disputation. The sword of argument was wielded by able hands. There were giants in those days, unless it be that distance of vision makes the characters that bore so conspicuous a part in that controversy go through a process of *looming*. The ground of debate has but slightly shifted since then. The swift-recurring seasons of pedagogical refreshment have seemingly brought with them new issues, but a study of those issues shows them to be but the natural and logical outgrowths of those that went before. The former advocates of science hold a consistent course to-day in standing in the forefront of those clamoring so pertinaciously for manual training in the schools. They lauded scientific study because of its hand-shaking acquaintance with the material side of life. For the same reason they see in the proposed union of school-room and work-shop, recitation-room and kitchen, a happy realization of much for which they have contended. * * * Those who favored the classics have widened the definition of the term. They have ceased unduly to exalt the literatures of extinct tongues. In English literature they recognize a treasure-house of original thought expressed in such terms as to carry it straight home to the intellect and the emotions of the reader. They would have the instruction given to the young touch all the eternal elements in their nature with quickening power."

The character of the speaker's address can be best stated in his own words, and was "in the nature of a protest against the materialistic tendency of the age, against that low, utilitarian idea of life that is dominating the minds and souls of our countrymen."

Superintendent Hartzler, in speaking of the County Teachers' Institute, said that in the absence of county supervision and "certain other things we ought to have," it is to be feared that too little is being done to reach the masses of the teachers of the State; each of the eighty-eight counties should have an institute. Mr. Holbrook thought that the progress of the institute was impeded by two conditions. In the first place, the examiners did not attend (which they should do, as they need quite as much as others "the information, suggestion, and inspiration of the institute"), while their absence discredits the institute in the eyes of the teacher. In the second place, the antagonism between those who desired pedagogical instruction to enable them to teach well and those who desired the instruction that would enable them to pass a good examination should be compromised. The compromise the speaker would propose was that these professional meetings should be academic only so far as to illustrate methods—"the institute should teach methods by teaching subjects." Superintendent White, of Cincinnati, after defending the institute from criticism which he thought implied by the remarks of previous speakers, would make no compromise with that class of teachers who demand that the institute shall be a means of preparing them for getting teachers' certificates. In his paper on the "Defects in the Public Schools of Ohio," Mr. Chaney spoke very much to the same effect as the president: "Let the school become the exponent of cleanliness as the church is of godliness; get clean teachers to inculcate clean secular doctrines and rigid moral civics, and such a reformation will sweep over this land as no nation has ever yet seen." Dr. Harris, of Concord, Mass., spoke "On the Necessity of Colleges to Supplement the High Schools."

The Eastern Ohio Teachers' Association was held at Steubenville, November 25 and 26, 1887. A paper was presented on the "Utility of English Grammar," on which a protest was made against unmeaning definitions; and analysis, diagrams, and parsing were advocated. Professor Gardy would answer the inquiry, "Why should we study pedagogy?" by saying that the mind must be understood before it can be trained. The session was concluded with a paper on "What we owe to our Pupils."

The South-east Ohio Teachers' Association held its meeting at Logan, November 25 and 26, 1887.

The North-west Ohio Teachers' Association held its nineteenth annual session at Fostoria, December 26, 27, and 28, 1887. The meeting was opened by a lecture on "Politics in Education." On the second day of the session ex-Governor Foster took the ground that there should be no school supported at public expense higher than the grammar grade. A resolution was passed requesting the General Assembly to enact the township system; bring about (1) uniform length of term; (2) uniformity of text-books; (3) a clearly defined but flexible course of study, and (4) a board with executive authority and with responsibility.

The State Association of School Examiners met at Columbus, December 28, 1887. Resolutions were passed urging the Legislature to provide for the expiration of the term of county and city examiners at the end of the school year, the examiners to be so appointed that the term of one examiner shall expire each year, and that they be required to make their report directly to the State school commission; that a proper interpreta-

tion of the school law does not permit examiners to extend the time for examination for one certificate to two or three successive examinations within the same quarter; that examination fees for State certificates be turned into the State treasury and the examiner be paid a specified sum, the fee to be three dollars to five dollars; that physiology and English literature be added to the common school course; and that boards of county examiners be given power to compel attendance of witnesses in cases involving the revocation of certificates. After voting to sustain the exertions of the State commissioner of schools in his efforts to have the present sub-district system of schools changed, the body adjourned.

The Superintendents and Principals' Round Table met at Warren, January 13, 1888. All the discussions were conversational and informal. Teachers' meetings was the first subject taken up. The members seem to agree in thinking that the chief object of such assemblages was to beget a good professional spirit and to maintain the courage and enthusiasm of the corps of teachers. As to professional reading there was no dissent to the statement that the most meagre outfit of a teacher is one good educational periodical, two or three good books on teaching, one good general newspaper, and one good literary magazine. A graded course in arithmetic prepared by Samuel Findley was discussed at some length. On the question of examinations and promotions various opinions were brought out. On one side it was maintained "that the unity of our work hinges on them," as they give the judgment of superintendent and teacher. On the other it was maintained that the daily record gave the daily judgment of the teacher. Against daily records it was urged that it requires the major part of the teacher's energy for marking, leaving but little for teaching. The question of percentage of attendance coming up, it was almost unanimously decided that many false statements had been published in reports about this matter. It was also decided that there should be a distinction between "tardy" and "late." A committee was appointed to examine the school law to ascertain if the parent has any right to say that his child shall not study grammar, for instance.

The Ohio and Indiana superintendents held a meeting at Piqua, February 24 and 25, 1888, at which questions relating to the attendance of pupils at school, free text-books, and hygienic criticism were discussed.

On the 24th of the same month the South-western Ohio Teachers' Association convened at Hamilton, and listened to papers on "Practical Botany," "What may we do to direct the Home Reading of our Pupils," "Teachers and Teaching," "The Classics again, or shall we teach them," "School-room English," and "The Teachers' Opportunity."

At the second meeting of the Eastern Ohio and Western Pennsylvania Superintendents' Round Table, held at Youngstown, Ohio, March 9 and 10, were discussed a report on a graded course in arithmetic, a report on school statistics, and a report on parents' right to select studies, followed by essays of a purely pedagogical nature. The Round-Table Meeting of the Superintendents and Principals of North-eastern Ohio and North-western Pennsylvania was held at Greenville, Pa., and will be noticed under that State.

OREGON.

The provisions of the new law relative to the examination and certification of teachers are given in an earlier chapter of this volume; as to the employment of teachers, the superintendent speaks as follows:

"The selection of teachers is often a difficult and delicate duty. The school directors are frequently beset by relatives of the applicants. Local influences are brought to bear. In some cases teachers are fearlessly and impartially chosen without regard to favoritism or nepotism in any form, while in others nepotism and partiality have prevailed without regard to the ability and experience of the person employed. The present method of examining teachers has been thoroughly tested for the past two years and the results have been carefully examined, and the general outcome of the work is a sure guarantee for educational success, and will aid in the selection of teachers. * * * Some directors think that young teachers should be preferred, because they possess claims on account of local residence, need of employment, and other reasons. Such influences should not prevail, and only those applicants who have the best qualifications, literary, professional, social, and moral, should be selected."

Institutes.—During the year the several district institutes required by law have been held at the county seats as a rule, and with good results. The county institute is now obligatory. Touching these the State superintendent remarks:

"There is no doubt that these conventions are of great benefit to teachers, as all active, thoroughgoing teachers concede this. While this is true, the institutes are not accomplishing all that is expected. The time allotted for the work is generally too short,

and for the annual institute the time set apart for the session should not be less than five days.

"In some instances the instructors have hardly time to present the outlines of their topics. Again, time is often frittered away in the discussion of questions of minor importance. Again, time is sometimes wasted by the extended discussion of special hobbies. The time should be largely devoted to the presentation of the most approved and latest methods of instruction."

Of the fifty-eight institutes that should have been held during the two years covered by the report only thirty-five were held. In attending twenty-one of these the State superintendent was obliged to travel 7,300 miles. The superintendent has prepared for the use of county superintendents and institute instructors the following "daily programme of a normal institute for six days:"

Forenoon.

General discussion by the entire institute, 9 to 10 o'clock.

Time, 10 to 10.30.		Time, 10.30 to 11.		Time, 11 to 12.	
First Day.	Second Day.	Third Day.	Fourth Day.	Fifth Day.	Sixth Day.
Orthography, Methods of and Principles.	Reading, Methods of and Principles.	Arithmetic, Methods of and Principles.	History, Methods of.	Language, Methods of.	Geography, Methods of.

Afternoon.

General discussion by the institute, 1 to 2 o'clock.

Time, 2 to 2.30.		Time, 2.30 to 3.		Time, 3 to 4.	
First Day.	Second Day.	Third Day.	Fourth Day.	Fifth Day.	Sixth Day.
Object Lessons, Methods of.	Penmanship, Methods of.	Arithmetic, Methods of and Principles.	Language, Methods of.	School Organization, Methods of.	School Recitations, Methods of.

The programme is merely suggestive of the work that may be accomplished, within the time specified, by an active conductor and assistant instructors, who give strict attention to economy in time and methods of work. The programme itself may be readily revised to meet the wants of the several districts and counties. Evening exercises may consist of lectures and general discussions.

To the members he would suggest that they—

- (1) Attend each session promptly and regularly.
- (2) Make copious notes of the work done and keep them for future use in the school-room.
- (3) Give their earnest attention to the instructors and enter heartily into all general exercises.

(4) Ask questions of instructors at the close of each exercise.

(5) In general discussions confine themselves to the general principles of the question in hand and not distort the discussion into "pet" specialties and personalities, remembering that the institute is a school and not a debating society—to instructors he would suggest that they are to teach rather than lecture.

Teachers' meeting.—The Oregon State Teachers' Association held its annual meeting in the capitol at Salem, July 6, 7, and 8, 1887. The meeting was attended by three hundred and twenty-five teachers, not only of the elementary but of the secondary and superior institutions of learning.

In the department of superintendence two of the great problems of the day, country schools and institutes, were up, manual training not appearing. The association has a novel feature, a department of music. In this were discussed (1) the best methods of teaching vocal music in public schools; (2) what should be the character of school music; (3) vocal music as an opening and a closing exercise; (4) methods of training childrens' voices.

Local meetings are increasing in number and in some instances have become in reality a teachers' institute.

PENNSYLVANIA.

In his last report State Superintendent Higbee speaks of the normal-school question in the following terms:

"In former reports we have had much to say in reference to our normal schools, which need not be repeated here. It is enough to call attention to the fact that in a Commonwealth requiring over twenty thousand teachers, if we hope to secure professional skill we must have normal schools. Such is the uniform experience of every State and nation where education finds public recognition. If our normal schools are to furnish teachers for our high schools only we have too many of them. If, however, they are to reach down to our primary schools as well and help to fix firm the foundations upon which all must rest, the eleven which we now have, although remarkably well attended, fail in supplying the demand. We regard these schools as a necessary part of our common-school work, and insist upon their watchful attention to the history and methods of instruction in every department of study which is embraced in the work of our common schools. They need and deserve the generous support of the State. We have for a long time thought that they should be more closely connected with the State. Without doubt the circumstances surrounding their inception fully justify their peculiar organization, and arouse the educational interest and zeal of the districts which are challenged to meet the severe demands of the law; the time has not yet come, we think, for any great change. We have no special legislation to ask in their behalf other than that they be generously supported in their work by the State."

Erie.—The training of the high-school graduates in the elements of practical teaching has met with greater success than was anticipated. Not theories and words, but skill in imparting knowledge has been the aim of the instruction.

The teachers' training class was organized September, 1883. The class of 1884 contained fourteen members; that of 1885, twenty-one; that of 1886, nine. Of the first class, eight do very good to good work in management and instruction and five do fair to good work. Of the second class six do very good to good work and eight fair to good. Of the third class five are making a very good or a good record, and three stand fair to good. Not every member of the class had become a teacher, and in making the comparison the best teaching has been taken as a gauge. The class has insufficient accommodations, and the superintendent thinks that it will be a decided step in advance when they are supplied. The teaching of the graduates of the training class has demonstrated their superiority over the graduates of the high school who have become teachers.

Philadelphia.—During the year three hundred and ninety pupils left the school, distributed as follows:

Obtained principals' certificates.....	29
Obtained assistants' certificates.....	157
Obtained trial certificates.....	21
Withdrew while teaching.....	9
Left during the term without submitting to the final test in teaching.....	10
Graduates who "did not intend to teach".....	11
Incapacitated by ill health.....	2
Needed at home.....	5
Deceased.....	2
Removed.....	19
Admitted but never attended.....	41
Failed during the term.....	51
Failed at examination.....	33
Total.....	390

The average age of the pupils in the school, 1,230, December 31, 1887, was seventeen and one-fourth years.

Two departments were added during the year—a kindergarten and a cooking department.

The course of study of the kindergarten department embraces psychology, history of education, physical culture, music, free-hand drawing and modelling, kindergarten philosophy, and practice in teaching. At the close of the year those who desire to teach will be examined in the above-named subjects, and those found qualified will be awarded certificates to teach in the public kindergartens.

The cooking department was established under the auspices of the Public Education Association, with the authority of the board of education and by direction of the committee on Girls' Normal School. At present it is supported by private contributions. It is thought that it will contribute largely to the proper education of the normal pupils. The instruction is confined to Class B, numbering 280, each of whom will receive during the year twenty lessons. The work, which is satisfactory to teachers and pupils, embraces the philosophy and chemistry of cooking, given through lectures and daily lessons.

The *minimum* age for admission to the normal school is fixed at fourteen. On the un-

desirability of fixing the limit so low, the principal remarks: "It is sad to see, every year, the almost superhuman efforts made to control the children in the school of practice by those who, because admitted to the school so young, are comparatively children themselves. And the final result, in many cases, is failure, or its equivalent to them, a trial certificate. It is sincerely hoped that should the board of education in its wisdom establish a girls' high school, as is now contemplated, they will see the great importance of fixing a riper age for admission to this [the normal] school."

In this comprehensive and thorough report we find a note of the work of the graduate students, whose teaching continues to give the most gratifying results. Although all labor assiduously for success, some attain it only with the greatest difficulty because too young to perform the duties required, while others fail because teaching is not their vocation.

Wayne County Summer Normal School, Honesdale.—In the summer of 1887, in response to the request of a number of teachers and directors, a summer normal school was opened and conducted in the Honesdale High School for four weeks with marked success and the most gratifying results. Encouraged by the results of this session a similar one was to be held during 1888, with increased facilities and a better knowledge of the wants of the teachers of the county. The object of the school is to thoroughly review all the common branches taught in the schools of the county, to discuss their organization and the aims of elementary teaching and its methods and means, to present education as a science, and finally to show the use and value of illustrative apparatus.

Institutes.—Sixty-six county institutes were held during the year from September, 1887, to January, 1888, and three city institutes. These institutes were in session five days each and were attended by 19,917 actual members, including 16,998 employed in the common schools of the counties. The directors present numbered 3,045, and the spectators 36,250. The number of instructors and teachers present was 641, and of essays read 214. The cost of these meetings was \$50,135, of which \$12,727 was paid by the county treasuries and \$15,321 by members.

Speaking of these meetings, the State superintendent says:¹ "To gain a clear, general knowledge of the educational work of the State one must attend the county institutes. In these annual conventions the superintendents can be seen in the very midst of their activity with all their teachers marshalled around them. Here, also, many of the most active school directors can be met, together with many of the most intelligent citizens, who thus show their interest in public instruction. Here, indeed, all the educational forces of the counties are in consultation, for our institutes serve a double purpose. While not neglecting the normal drill and instruction of the teachers, they awaken public sentiment in reference to their work and success. Hence here the various educational tendencies of the State reveal themselves, and can be studied as nowhere else, and either checked or encouraged as the case may seem to require."

In comparing the Pennsylvania system with that of an adjacent State the superintendent says: "We prefer the Pennsylvania system; for, while demanding the best exertions of the superintendent in behalf of his teachers and their work, and giving him full freedom to make himself powerfully felt in their advance, it at the same time challenges large communities to an increased interest in the work of the schools, and gives the State department the very best opportunity of knowing the educational interest and sentiment in the various communities of the Commonwealth."

Teachers' meetings.—The thirty-fourth annual session of the Pennsylvania State Teachers' Association was held at Scranton, July 3, 1888. Education as a qualification for voting, the beautiful as an educational factor, temperament in education, education and heredity, education and crime, and education and industry were before the association during its several days of session. Questions so large as these require, even as abstracts, more space than may here be given; an abstract of the several speeches on industrial education, however, will be given in Chapter XV, Section III.

Dr. Wickersham in his paper on "Free Text-Books" said: "To make a school free, you must make all free that belongs to it. To the school belong the house, the furniture, a teacher to impart instruction, and suitable apparatus to aid him in the task, and to these must be added the text-books, for they are the teacher's tools and as necessary to the pupil as a seat or a black-board. Without free text-books systems of schools are not free."

Miss E. M. Reed, late principal of the Reading training school, in her paper on "Primary Work; its Purpose and its Character," grouped her remarks under four heads—the intellectual, the moral, the æsthetic purposes in primary work, and, finally, its character. The primary course is from six to ten. At this age presentative power is most active, and memory and imagination are standing ready to use the products of knowledge gained through the senses. Reason and judgment will soon catch the disjointed threads of facts, weave them into comparisons, and measure off generalizations,

¹Pennsylvania School Journal, Dec., 1887.

But facts must be furnished and the greatest stress should be put upon the sense-conceptive power. A common fallacy among teachers is to think that the "moral welfare" of the child will take care of itself. False excuses should not be listened to and sham of all kind avoided. Practical every-day acts of self-control, honesty, and obedience on the pupil's part are worth volumes of precepts to the child, when he is a man. Closely allied to moral training is cultivation of a sense of the beautiful. Call attention to the beauty of the clouds, to the beauties of a brilliant sunset, the harmony of colors, and of symmetrical forms, and read stories, such as Ruskin's "King of the Golden River." Primary teaching, in the first place, should be objective, and in the second, oral.

Professor Heston, of the State College, would answer the question, "What can the University do for the Common School?" by saying establish chairs of pedagogics, to train men in the science of teaching—not the technical work of the normal school, but the training of educators, who shall create and mould educational sentiment. The "chair of pedagogics" would train men for professorships in normal schools, who would put life into the science of education.

Mr. Shimmell, of Philadelphia, presented the "Teachers' Tenure of Office." No feature of the American educational system, he said, is so discouraging to teachers as the uncertainty of their tenure of office. Low wages, frequent examinations, and short terms all tend to degrade the profession, but the worst of all is to be dismissed without cause. If the teacher cannot be dismissed before the end of a term unless for "incompetency, cruelty, negligence, or immorality," why should he be dropped at the end of a term unless for the same reasons? It is a deplorable fact that many teachers fail to make a re-election because they are antagonized by a few influential men with a grievance. It may be said that a charge of incompetency or negligence would be hard to prove; and indeed these terms are so indefinite, that thousands of dismissals are wrongfully made by virtue of their comprehensiveness. Teachers sure of their tenure might become indifferent to their professional progress and duties, it may be said. Not so; uncertainty, not certainty, destroys ambition and enthusiasm.

Superintendent Sturdevant, in his paper on the "District Superintendency," said that more than one-half of the entire number of schools in the State are single, ungraded, country schools. The number of children attending the country schools is not known, but it is probably more than half of the 930,000 in the State. Notwithstanding the neglect of these schools by "doctors of pedagogy" and "distinguished foreign and domestic visitors," they are neither numerically nor vitally less important than the better provided for city and borough schools. Throughout these schools there is a want of intelligent, concentrated, continued work. For this there is no single remedy; but one of the most important is closer and better supervision. Directors do faithful work, devoting no small amount of time gratuitously to school meetings; but few of them would claim ability to supervise schools as to methods. If there is no complaint the school is successful. In large counties the county superintendent can, with his other duties, visit the school but once a year. Where the teacher is to be trained and her methods radically changed he can do but little. The need of district supervision has long been felt in Pennsylvania. The law of 1885 provided for superintendents in cities, boroughs, and townships having over five thousand inhabitants. But the law was a blunder: for not one township in a hundred has a population of five thousand. Create in each township having not less than ten schools, or in two or more adjoining towns having not less than ten or more than twenty schools, a principalship to be filled under the same provisions as borough principalships.

On the following day a resolution was passed asking the State superintendent to use his influence in securing legislation for establishing throughout the State a district superintendency subordinate to county supervision. Other resolutions were also passed emphasizing the importance of temperance as a study in the public schools; favoring free text-books; commending the recent action of the Legislature in fixing the minimum school term at six months; for increasing the State appropriation, and for paying teachers while attending institutes; denominating the normal schools as an essential feature of the school system; favoring a closer union of the public schools and higher institutions of learning; and finally welcoming the present agitation of the subject of manual and industrial training as well calculated to secure consideration of the practical ends of education.

On January 26, 1888, the city and borough superintendents east of the Alleghenies met at Lancaster. Five topics were discussed: Examination of schools, Qualifications for transfers, Intellectual growth of teachers, Teachers' meetings and institutes, and High school commencements. We regret that we can only speak of the second and third topics, which are especially appropriate to this chapter. Superintendent Gotwals thought that teachers did not read enough either professionally or generally; Superintendent Ballentine, that increased professional knowledge was closely connected with in-

crease of salary; a view concurred in by Superintendent Shelly. Superintendents Hoffman, Harpel, and Buehrle said the teachers under them were following a course of professional reading. Superintendent Shelly holds two meetings each month two hours long in the evening. A normal class, consisting of those learning to teach and those who have had less than five years' experience in teaching, meets twice a month. Superintendent Ballentine calls special meetings when necessary; Superintendent Gotwals holds semi-monthly Saturday meetings of teachers of different grades; Superintendent Harpel reported meetings of teachers and directors.

On the 10th of April, 1888, the county, city, and borough superintendents met at Harrisburg. The attendance was made up of fifty-one county and thirty-five city or borough superintendents, and five normal school professors.

Superintendent Wolf, in addressing the convention on "Institutes and their General Management," said that institutes were valuable as causing the association of teachers, fostering a professional spirit, inculcating professional knowledge, affording an opportunity to hear the keen, pointed address of experienced educators, serving to awaken public interest, and finally, as the best means of communication between the several executive branches of the system. A committee having been appointed to report on the best time for holding the institute, it was recommended that no institutes be held during the last week in December, known as "holiday week;" that in counties having the longer average term the institutes be held as soon after the opening of the term as possible; that all superintendents be requested to decide on the time of holding their institutes as early in the school year as practicable, and at once report the date to the superintendent of public instruction.

The percentage and statistics of attendance received attention. The State superintendent was requested to prepare a definite rule governing the matter of obtaining a percentage of attendance, which caused Dr. Higbee to remark: "After the rule is made how are we to prevent some from reporting 125 per cent?" and Superintendent Patterson to say that the present instructions are plain enough for those who are willing to follow them.

Dr. Buehrle offered a resolution that free-hand drawing be included among the branches required to obtain a teachers' certificate, as well as among the branches of study in every school district. This was proposed to obtain legislation, and if industrial education is to be introduced, this was the place to begin. After amending the resolution by omitting the word free-hand the resolution was adopted. Superintendent Shelly spoke on the "Selection and Transfer of Teachers," and Superintendent McNeal on the "Examination and Qualification of Teachers."

Dr. Wickersham, having been invited to address the convention, recalled the first meeting of the Pennsylvania superintendents thirty-four years ago in the very hall in which his hearers were then seated. "I well remember," he said, "that peculiar body of men, most of whom have gone to their long homes. When those first superintendents were elected few of them had any definite knowledge of what they were to do, and some counties elected them to do nothing. McKean County fixed the salary at \$250, and it cost the superintendent one-half of it to come to the meeting, and that was the earnest of the years of faithful work that followed. Berks made the salary \$250, expecting the officer to resign; he did not, but came here, went home and served his term faithfully. The superintendent of Somerset, if I am rightly informed, walked all the way from his county to Harrisburg to attend the convention and back home again, being unable to pay his fare on the railroad. * * * What the body lacked in educational knowledge it made up in zeal, and to that small body of men this Commonwealth of Pennsylvania owes a debt of gratitude that can never be paid. * * * I was a member of that convention, and have been in all but one or two since. * * * And while I know, and am glad to know, that the least of you may be in advance of the best men of that day, I hope you will not forget that they were as willing to work and to make sacrifice, perhaps more so, than any who have followed them."

In the November number of the Pennsylvania School Journal the action of the school directors of Schuylkill County, in forming a "directors' association," is the occasion for the editor's inquiry, "Why not organize similar associations of school directors in all the counties of the State?"

At the twentieth annual session of the Wayne County Teachers' Institute, held at Honesdale, January 2-6, 1888, Principal Twitmyer, in speaking of the cause of poor schools, said they were due to (1) the poor building, (2) the constant change of teachers, (3) short terms, (4) irregular terms, (5) poor classification, (6) inadequate supervision, and (7) indifference on the part of the community. On the part of the teachers the cause was due to (1) insufficient education, (2) lack of professional training, (3) want of judgment, and (4) want of enthusiasm; and to rectify these last evils as far as possible was the object of the institute.

RHODE ISLAND.

Johnston.—"Important as buildings, apparatus, books, and the prompt attendance of the pupils are, the motive power in the school is the teacher," says the superintendent. "To secure such teachers two things are necessary: First, to demand the qualifications which are essential in the competent teacher; and, second, to offer the compensation which corresponds to ability of that class. * * * No one, however, ought to attempt to teach, and I think no one ought to be authorized to take charge of a school who has not made the work of teaching the subject of special, careful, and thorough study; if not in a normal school, then by extensive and wisely chosen reading, by visiting schools, by listening to discussions of educational questions, and in whatever way insight into the science and art of teaching can be obtained."

Newport.—The city superintendent continues his appeal for a training school for teachers, considering it "as the principal educational question before us." He asks the board to consider the question in view of the probability that the vacancies occurring in the corps will have to be filled by promising, yet untrained, young lady residents. The present plan of employing assistant teachers is a good one, so far as it goes, but vastly inferior to the training school, which could be established without an increased expenditure.

As to the work which would be attempted in the training school, it would be the duty of the principal to give daily, out of school hours, say at 11.30 A. M., to her pupil teachers a lesson upon the principles and methods of teaching, such as are given at the State normal school, the class being required to make diligent study of the subjects. These lessons would include, among other things, an exemplification of the best ways to teach the common school studies, making constant reference to a pedagogical library, which should be established. In school hours it would be the duty of the principal to instruct the children of the four rooms in succession, requiring the pupil teachers to observe, and afterwards to repeat and continue the lessons.

No person should be admitted who had not received an academic education, and any admitted that gave little promise of success should be advised to withdraw. After a service of twelve or eighteen months a diploma of graduation should be given.

Of the fifteen or sixteen teachers appointed to teachers' positions in the city schools during the last six years but five or six had followed a normal school course. The schools of Newport, says the superintendent, must inevitably lose their creditable standing unless they shall be governed by a recognition of the principle that obtains in professions other than teaching.

Pawtucket.—"Referring to your circular," says Superintendent Sherman, "asking information about our 'Normal' schools, etc., I have to say that our Training School, so called, is only an attempt, on a small scale, with the means at our disposal, to do the best we can in this matter as a beginning. It is not large enough, complete enough, sufficiently systematized, nor well enough established, for us to make any claims, or look for any results as bases of opinion as to its merits as yet. Of course we hope it will prove a success, and mean to make it better as fast as possible."

Teachers' meetings.—The meeting of teachers held at Cranston, in February, was sufficient to prove, says the school committee, that they are a great help to the teachers. It is hoped that at least three will be held during the year 1888-89.

The forty-third annual meeting of the Rhode Island Institute of Instruction was held at Providence, in October, 1887. We have no report of the proceedings. The Barnard Club, of Providence, has opened its membership to teachers from other parts of the State.

SOUTH CAROLINA.

In his report for 1888 the State superintendent thus speaks of the normal school and institute work of this State.

Normal schools.—"The Legislature established a normal college for males within the South Carolina University. The trustees placed at its head Dr. E. E. Sheib, a gentleman of liberal culture, who came to us from similar work in the College of Louisiana. He has already made an auspicious beginning in institute work at Orangeburg, where he was given a most hearty welcome. He is aided by an able faculty, and those who attend his classes will have exceptional facilities for acquiring the most improved methods. By a happy arrangement with the trustees of the Winthrop Training School, the students of both institutions have the privilege of attendance upon the lectures of both colleges and the practice classes of the latter.

"The Winthrop Training School for Females was established two years ago. It was founded by Superintendent D. B. Johnson, with slender means, and seemed as frail a bark as the Mayflower of the Pilgrim Fathers. To the timid it promised nothing but disaster to mariners and crew. Under the skilful and practised hand of its president, it has weathered the storm.

* * * * *

"Two classes have been graduated from this institution, and, without exception, are employed in positions of usefulness. The State gave to each county a free scholarship, which was filled during the summer by competitive examination. The institution opened under the best auspices, with fifty-one students in attendance. There were over one hundred applicants for the scholarships. The money for these beneficiary pupils is paid out only on my order, after the certificate of Superintendent Johnson is presented.

"This movement is rich in promise alike to the State and to these young ladies. We secure trained talent for the schools, and they have the means of an honorable living. This is the first dollar South Carolina has given to educate her daughters, and it has been most worthily bestowed. The standard for admission, now good, will be gradually raised, and the most progressive and modern methods of teaching will be presented here. Superintendent Johnson is ably and faithfully seconded by his faculty.

"In behalf of the women of the State this school demands active and intelligent support. It is proper to say that this effort was made possible by the liberality of the Peabody trustees, through their accomplished secretary, Dr. S. A. Green. The name was given in honor of the Hon. Robert C. Winthrop, the patriot and scholar, whose interest in its success has in various ways been manifested. Institutions for normal training are now a part of the ordinary educational machinery, and need no vindication. They are to the teacher what the moot court is to the attorney, the dissecting room to the physician, the studio to the artist. They present the most matured views of the most successful teachers. The student, it is presumed, has gathered the knowledge of books, and in these training grounds he finds out the readiest means to impart information. It is presumed that the State has only begun this work. Modifications may and will be needed in the plans of operation and in the methods of assistance. She can never retrace her steps.

Institutes.—Sixteen county normal institutes have been held in the State during the year. In Greenville were gathered two hundred and fifty teachers. For two weeks instruction was daily imparted by a large faculty. In Orangeburg the attendance was large, and, daily, numbers of citizens assembled to hear the instructions of the very able faculty in charge. One unusual and very interesting feature was the "Trustees' Day." By active effort School Commissioner Mellichamp secured the attendance of about sixty trustees, and I had the pleasure of addressing them on the subject of their relation to the work of common schools. It was, indeed, a great source of gratification to see such a gathering of representative men from all parts of the county, who gave their time and energies to the public service without pecuniary reward. The reports from the other counties show a large attendance and a great amount of good done by these annual gatherings of the teachers. The amount of money allowed by the State from the county school fund is handsomely supplemented by the trustees of the Peabody Fund. I am sure no other agency and no equal amount of money spent does more good. It is the only aid for the teachers in the field. They need this help, they desire it, and they use it for the best purpose. The only change I suggest is that the institutes should be under some one general direction, and the faculty and work selected by this agency. One week's faithful labor will kindle enthusiasm, weld into a common purpose the varying plans of separated teachers, direct into one channel the divided forces of distant sections, and impart what is valuable in new methods to old teachers."

Florence.—The graded school of this town has a normal department connected with the high school. Its object is to prepare teachers. The pupils are taught: (1) A knowledge of the common school studies and the best methods of teaching them; (2) psychology and its application to teaching; (3) school management. During the whole course special attention is paid to class methods, the art of questioning, kindergarten methods, methods of teaching elementary branches, and methods of teaching the higher branches. There were five pupils in the senior class and ten in the junior.

Teachers' meeting.—The annual convention of the association was held July 11, 1883, at Columbia. The State superintendent addressed the assemblage on the merits and defects of the State school law. The subjects of History, English, and the Bible in our schools were presented and discussed. Miss Bonham, of the Winthrop Training School, urged the necessity of reading school journals and books on education as (1) stimulating; (2) as arousing professional pride; and (3) as a means of getting new ideas. Mr. Clinkscapes said the great obstacles to the success of the State school system were want of money and competent county supervision. County commissioners should be appointed, not elected. Miss Martin, in speaking of Moral Training in the Schools, said the foundation should be laid at home, and that public exhibitions and prize-giving are pernicious, because they foster a love of display. In discussing the question, "What Constitutes a Model [ideal] School," Mr. Baird said that the schools had been too long used by young college graduates as stepping-stones to other professions. Mr. Curtiss said the object of an institute was to instruct the non-professionally trained teachers, and that institutes should be conducted by skilled persons. Superintendent Greenville, in speaking of

teaching as distinguished from cramming, said that it was the art of causing to know. It was a profession, and the school room should be no longer an asylum for briefless lawyers, preachers without churches, and doctors without patients. Miss McCants spoke of the "Professional Qualifications of the Teacher." A good teacher, it has been said, is possessed of three qualities: knowledge, patience, and sympathy. The speaker would add a fourth, discipline.

During the session the chairman of the committee on membership stated that of the 3,000 teachers in the State but 110 are members of the association. Among the several resolutions passed was one expressing the gratification of the meeting at the action of the last Legislature in recognizing it to be the duty of the State, to herself and her children, to provide professional training for the future teachers of the public schools, as shown by the provision for the professional training of young men at the university and of young women, by means of county scholarships, at the Winthrop Training School. Some advance was made in the matter of arranging for a permanent place of meeting.

TENNESSEE.

The Peabody Normal College, late State Normal School, has been referred to in the foregoing. It only remains to notice the other State agencies for the training of teachers; and first—

Institutes.—These for the last year have been very successful, says the State superintendent, and are doing much to improve the country school teachers, but few of whom have been professionally trained. Twenty-three Peabody Fund institutes were held, seventeen for white and six for colored teachers. They each, as a rule, continued in session for one week, but in some instances two, and even three. Besides these a majority of the counties of the State each held a local meeting of the kind.

Teachers' meeting.—The twenty-fourth annual session of the Tennessee State Teachers' Association met at Cleveland, on August 7, 1888. The manner of proceeding of the association being to refer subjects of special importance to a committee for report, as is done in legislative assemblies, our attention is naturally drawn to the expressions of opinion of these committees. The Committee on Pedagogy reported that to secure the professional training of teachers the requisite is normal instruction, which should be imparted, first, through normal schools or colleges; second, through teachers' institutes or summer normals; and, third, by prominent schools and colleges instituting a chair of pedagogy; that this instruction should be given at State expense; that skill is fostered by State and county supervision; that books and journals, associations and reading circles are an educational necessity; that a monthly outline of "pedagogical" study should be prepared, which county associations should make a prominent feature of their work; and that a column of the county newspaper should be secured for discussion of the county school affairs.

The Committee on Teachers' Institutes made a report providing for State and county institutes. The Committee on Literature reported in favor of the topical method, with the text-book as a book of reference; that the institution should begin on the lower grades and with American literature, and then English, closing with American. "We discussed the reason," the committee says, "why literature should be considered a prominent branch of school work, and came to the conclusion that for the development of the thinking power of the student and for the formation of a habit of accuracy it could hardly be excelled."

The report of the Committee on the Work of County Superintendents endorsed the work of that office, pointing out its well known usefulness when properly filled. The Committee on Primary Work in its report advocated among other matters that the child be put to writing the first day it enters school. "Do not waste time on the alphabet; teach words." The Committee on Manual Training endorsed that subject as education and recommended that it be a permissible study of the common school course. The Committee on School Supervision distributed that subject into four categories, State, county, city, and by principals. Only the last of these calls for particular attention. Assuming other qualifications, the principal should be familiar with the course of instruction, that he may be able to properly assign any pupil on entrance. To do this there must be a system of grades, observation of class-work, and exemption of the principal from class-work, say, for one-third of the day.

TEXAS.

In treating of the normal schools of the State, the State superintendent speaks of the Sam Houston Normal Institute as a powerful factor in the improvement of the school system, and of the inadequacy of its building to accommodate the rapidly increasing number who attend. A building worthy of its importance and usefulness is asked. But there is a demand for another school of the kind caused by the size of the State and

the necessity of having more teachers. The Prairie View Normal Institute, the outcome of a failure to establish a branch agricultural and mechanical college for the colored people, is reported to be in a prosperous condition. Manual training has recently been introduced. The school is still under the control of the directors of the Agricultural and Mechanical College. A chair of pedagogy should be established in the State university, for there should be some institution in the State capable of preparing high school teachers and scholarly city and county superintendents.

Institutes.—The State superintendent, in speaking of these, says that as the normal schools affect directly but a small portion of the work of the schools, scarcely a ninth of the schools being taught by teachers who have enjoyed the benefits of a normal school, the professional improvement of the other teachers must come through the institutes. Yet as only one-third of the counties hold institutes, measures must be taken to introduce them more generally. The attendance of teachers should be made mandatory, their pay continuing, and three or four experts should be sent to the several counties to organize and conduct institutes for one week each year. As an aid to institute work a programme of exercises for six institute meetings, to be held in the months from January to June, inclusive, was sent out by the superintendent, and if followed will improve the institutes generally. But the difficulties in the way of the institutes are so great under the present law that little hope can be entertained of their general success until it is amended in the particulars above suggested.

Teachers' certificates.—Still using the report of the State superintendent, we find that as an aid and guide to the boards of examiners, complete sets of examination questions have from time to time been sent out, with complete instructions as to the manner of conducting the examination, a plan that has given satisfaction and might be well embodied in the statutes. These examinations, however, only test one side of the teachers' qualifications; the final test is the work in the school room, but for this the law makes no provision; county superintendency should be mandatory, not optional. The requirements for teachers' certificates should be raised, especially those for the second and third grades, and no person ignorant of the theory and practice of teaching should be authorized by the State to teach a public school. A higher grade of certificate than the first should be instituted, relieving men and women of undoubted ability from the annoyance, and sometimes humiliation, of repeated examinations by men in every way inferior to them in knowledge and skill.

Teachers' meetings.—The annual session of State Teachers' Association was held June 26, 1883. The president, in his address, spoke of the various influences and qualifications not of a pedagogical nature which often avail more than professional knowledge in the selection of a teacher. He criticised the want of zeal in teachers in failing to join the association, remarking that of the ten thousand teachers in the State only two hundred were present, and that there were teachers in their State that did not know that they had an association. Of the several papers on "Enthusiasm," "Conversation," the "Public School System of Texas," and others, the Office has no full account.

The public school superintendents of North Texas met at Dallas, October 29, 1887. We have no record of the proceedings.

VERMONT.

At the normal school at Castleton the standard for admission has been steadily raised, being now 75 per cent., while for advancement from class to class in course the percentage required is 80. This has resulted in a corresponding advance in the age of the pupils attending the school, the recent graduating class averaging twenty-one years. In the last seven years the first course of study has been lengthened from one to two years, and from it have been graduated one hundred and thirty-one pupils. The second course has been lengthened from one to one and a half years, and from it have been graduated twenty-four.

At the normal school at Randolph ten weeks were recently added to the time for the study of pedagogical subjects and ten more are to be added during the coming year, so that now for seventy of the eighty weeks of the course a study of the principles is one of the four main lines of work. But the study of education, says Principal Conant, from whom we have quoted the foregoing facts in regard to this school, should extend through the entire course, and more time is needed for the study of natural science.

We can not do better in closing these brief remarks on Vermont normal schools than by quoting from Principal Leavenworth's report to the State superintendent: "The normal schools of the State are meeting and supplying the demand for better equipped teachers. Many attend for a part of the course, and then engage in teaching. So great is the demand for their services it is difficult oftentimes for them to get away from their schools so as to return and complete the course. For the amount of the assistance received from the State, it is gratifying that the normal schools have been able to do so

much. The best training in methods I conceive to be the most thorough instruction in the branches to be taught, and the uniform success of our graduates seem to fully warrant this conception."

Teachers' meeting.—The annual session of the Vermont State Teachers' Association was held at Brandon, January 26, 1888. Mr. Hume, of Boston, spoke of the tendency to teach too many things. Right thinking and right acting should be the real fruits of education. Miss Wells, of the Castleton school, in her article on "English Grammar," thought that pupils should be led to see that grammar in books is the same as grammar in ordinary life. Mrs. Dewey, in her paper on "Morals and Manners," thought that incidental teaching of morals in the school of more value than formal instruction. The teacher should be an object lesson on the subject. In Miss Lowry's paper on "Books and Schools," it was said that it was quite as essential to teach children what to read as to teach them to read; and to do this the teacher must be capable of judging as to the value of a book. Principal Conant, of the Randolph Normal School, spoke of the need of more teachers' associations in the State. The association of one teacher with one book of acknowledged excellence in teaching and then with another book, is also one of the teachers' associations that should be multiplied *ad libitum*. Principal Dutcher urged that American history and literature should be studied by American pupils. Civil polity should also be taught in the high school. Professor Yager, of Middlebury College, delivered an address on "Missing Links in Education." Legislation will not supply the place of ability to manage. In most cases there has been an abundance of stimulus resulting in attempting too much and mastering too little. Discipline is of much more consequence than scientific information. The fundamental studies should be kept fundamental. The natural method which has constantly in view the essentials, should be employed, thus imparting intelligence to the pupil without making him especially learned. But the link most generally missing is the educational spirit, which can only be begotten by a better conception of what education means.

The association passed a resolution before adjourning expressing their pleasure at the appointment of a commission to study the school system and to remedy defects, should they be found, and recommending that the duty on foreign educational books be removed.

VIRGINIA.

By the act approved March 5, 1888, the College of William and Mary¹ became a normal college. The first session began on the 4th of October, 1888. Each county and city in the State is entitled to one pupil, who is to be nominated by the county or city superintendent, and instructed without charge to him, while his living expenses are not to cost him more than ten dollars a month. The number entitled to admission is 115, and the annual cost to each \$90. Such pupils are to give satisfactory assurance of their intention and willingness to teach in the public schools of the State for at least two years.

The admission requirements are reasonable proficiency in the studies of the common schools, some of which will be reviewed in the college with special reference to illustrating and exemplifying the best methods of teaching them. The course of study is in (1) English and history; (2) mathematics; (3) Latin and Greek, French and German; (4) natural sciences; (5) moral sciences; (6) pedagogics. The organization was effected on the 5th and 6th of July, 1888, by the election of a faculty.

Institutes.—Eight Peabody and eight county institutes were held during the year. The Peabody institutes continued through four weeks with one exception, when the session was double that term. The attendance of white teachers on the five for them was 940, and of the colored teachers on the others 294; in all 1,234. The attendance at the county institutes was 322, the time of session varying from two to eight weeks. To these figures should be added the 131 teachers attending the institute of five weeks, held at the Virginia Normal and Collegiate Institute, and the 49 teachers enrolled at the institute of four weeks, held at Hampton.

We take the following notes on these meetings from the article by the State superintendent in the Educational Journal of Virginia: "While it is not now intended to foreshadow the policy touching institute work for the next year, it is but just to say that the policy adopted this year is abundantly indicated by the results attained. * * * As a general remark it can be justly said that the work was worthy of high commendation. In some of the institutes the teachers met at the first hour in general assembly for religious exercises and general lectures. Thereupon they were distributed into two or three classes or sections, occupying separate rooms, and instruction given on the class plan. * * * There is one point in this connection to which especial attention is

¹The vicissitudes of this college, the second to be established in the land, are given in Circular No. 1, 1887. To be had on application to this Bureau.

called, and that is that a good many teachers are late in entering the institutes and many of them drop out before they close. * * * An institute is a school. Therefore those who attend it ought to be present when it opens and remain till it closes if they would secure the full benefits of the course of instruction given."

Teachers' meetings.—The sixth annual conference of the county and city superintendents was held at Richmond, November, 13, 14, and 15, 1888. Dr. Curry, agent of the Peabody Fund, said he was glad to hear the State superintendents speak of the free schools as an *established* system. He could remember when every step in the progress of the work had to be fought for. No people had ever been educated except by the State. The right and duty of the State to educate is based on the law of self-preservation. The perpetuity and the very existence of the nation is dependent on the education of the people, and to secure this important end the State has a right to proceed by taxation. Beyond this no such right exists. The first subject of discussion was "Teachers' Salaries as Dependent on the Average Attendance of Pupils." The committee appointed to report on this subject recommended that a circular, giving the rules and regulations regarding discipline, lack of text-books, and sparsely-settled districts, be issued; that all issues arising under these laws are to be decided by the county superintendent; that the county superintendent draw his receipt for the teachers' monthly report according to the actual enrolment and average daily attendance, and that the salary be for such sum as he may think the law justifies; and, finally, that the laws are not intended to work hardships to the teachers, but to secure faithfulness and efficiency and prevent the multiplication of small schools. An amendment requiring the teacher to report the number of children not attending school and the reasons was lost, and the resolution adopted.

The committee to which was referred the topic of "Examination of teachers—what changes are needed in existing laws and regulations," reported that the State superintendent should urge the Legislature to legislate upon this subject; that a diploma from a Virginia State normal school or the Peabody College at Nashville should constitute the holder a qualified teacher; that a State certificate be instituted; and, finally, that county superintendents should not be required to hold examinations in a district upon demand of its school trustees.

The committee on "Normal institutes—how can they be improved?" reported that (1) a well-graded course of instruction covering at least three years should be established, and (2) the appropriation should be increased.

WEST VIRGINIA.

The State superintendent writes to the agent of the Peabody Fund, as follows:

"Our normal schools are making commendable progress, and are doing a great work for our public schools. I will give the enrolment of the six schools for the past four years, that you may see how encouraging is the increased attendance: The total enrolment for 1885 was 687; for 1886 it was 727; for 1887 it was 766; for 1888 it was 890. The number of graduates for 1888 was 47.

"I have taken a special pride and interest in doing all in my power to promote the efficiency of these schools, and feel confident they are in better condition than at any other period of their history. Yet I am frank to state that on account of limited appropriations for their support their usefulness has been very much hampered. With larger and better trained corps of teachers, and better library facilities, and more apparatus, their usefulness would be greatly increased. Those advantages can, however, only be secured with larger appropriations than they now receive."

Institutes.—The teachers' institutes have also increased in attendance and efficiency, and the superintendent continues: "The enrolment for 1887 for the term of five days was 6,301, being about 1,200 more than the number of teachers employed in all the schools of the State. The reports from forty-seven counties for this year [1888] have been received, showing an enrolment of 5,451.

"A very successful normal institute for a term of four weeks was conducted at the State University at Morgantown, beginning the 18th of last June. This institute was under the auspices of the faculty of the university, and the success was such as to warrant a permanent organization for an annual institute of six weeks at this institution. I hope to see next year similar institutes established at two of our normal schools.

"It is not necessary that I should comment upon the service the institute has done in the improvement of our teachers, the advancement of our schools, and the elevation of public sentiment. It has been an invaluable factor, and upon its continuation we must largely depend in the future for the training of a large number of our teachers and the education of a more favorable public sentiment for popular education."

For the meeting of the State Teachers' Association see under Maryland.

WISCONSIN.

At the meeting of the board of regents of the normal schools of Wisconsin, at Madison, June 25-27, 1888, several important measures were adopted. One of these was the adoption of a report submitted by a committee of the board as a plan for unifying the conditions of admission to normal schools and to extend the influences of the examinations. By this a committee composed of two members of the board and the presidents of the normal schools is to prepare examination papers and direct local examinations for admission to the State normal schools. These local examinations are to be held twice a year in such counties as apply through their county superintendent, and are to occur simultaneously in the several localities. The papers made are to be sent to the president of a normal school, and are to be examined and ranked by the teachers of the school. The secretary of the board is to be informed of the results, and will issue certificates to all successful candidates. It was also provided that graduates of the three years' normal course of the Milwaukee high school, and of an advanced course of one year in the same high school, may be admitted to the normal school of Milwaukee and be credited with the equivalent of one year's work therein.

The presidents of the several normal schools, through President Albee, presented two reports to the board upon matter referred to them, the first of which is as follows:

"In compliance with the direction of your board, in resolution prescribing a professional course of one year for normal schools, the undersigned submit the following course and suggestions for your consideration:

"(1) That the conditions for admission to such course be the same as provided in said resolution, namely, examination upon all branches required by law for a first-grade county certificate, and proof of three years' successful experience in teaching.

"(2) The course of training shall consist of:

"(a) A course of ten weeks in review and methods upon each of the following-named branches: Reading, arithmetic, geography, grammar, writing, and physiology (especially in the hygienic effects of stimulants and narcotics).

"(b) A special course of twenty weeks in school management, as related to organization, discipline, classification, courses of study, and school law.

"(c) A course of twenty weeks in theory and art of teaching, supplemented by twenty weeks of class teaching in school of practice.

"(d) A course of twenty weeks in drawing, and at least ten weeks in composition.

"(e) A course of twenty weeks in psychology, which shall 'clearly include' an examination of the nature and classification of the mental faculties, their laws, and methods best adapted to their development."

The second report is to the following effect:

"In response to your resolution of February 2, 1888, directing us to report 'what revision of professional instruction in the advanced course is necessary, if any, in view of the action of the board at the present meeting,' we would submit as follows:

"(1) That it does not appear to us that any material change is demanded, the professional instruction in the advanced course being already properly coordinated with that of the elementary course, which most of our students will still find it necessary to pursue; but

"(2) That we would request of the board such an interpretation, or modification, of the resolutions relating to high school graduates as will permit the substitution of reviews in the common branches with methods, theory of teaching, and practice work, in place of those studies of the advanced course in which the student is found to be proficient."

These reports were adopted.

Institutes.—At this meeting of the board of normal school regents, Regent Thayer, for the committee on institutes, presented the following report:

"During the year closing with this date eighty-four institutes have been held under the direction of your committee, in sixty different counties and superintendent districts. Fifty-three of these were held in the summer and fall of 1887, and thirty-one in the spring of 1888. Of the former, twenty-nine were in session one week, twenty were in session two weeks, one was in session four weeks, one was in session three days, and two were in session two days. Of the latter, twenty-two were in session one week, four were in session two weeks, one was in session three days, and four were in session two days, making a total of one hundred and six and three-fifths weeks. The short-term institutes were held for the benefit of graded school teachers, by request of city superintendents and principals of high schools, at the following places: Ashland, Boaz, Eau Claire, Fond du Lac, Menomonie, Neenah and Menasha, Racine, and Waukesha. In each of the counties of Fond du Lac, Richland, and Sauk three institutes were held. In both the first and second districts of Dane and in each of the counties of Barron, Bur-

nett, Clark, Dodge, Dunn, Eau Claire, Green, Kewaunee, Marquette, Price, Racine, St. Croix, Trempealeau, Vernon, Waukesha, and Winnebago two institutes were held.

"Comparing these statements with the report of the preceding year, it will be seen that seven more institutes were held; two more counties and superintendent districts are included, and thirteen weeks' more time was covered this year than the year preceding.

"Besides the five regular conductors, forty-five assistants were employed.

"The total expenditures have been classified as follows:

Salaries of conductors.....	\$4,601.50
Expenses of conductors.....	1,840.87
Printing.....	169.00
Incidental expenses.....	301.44
Total	6,912.81

"In all the institutes held there were enrolled 1,497 males and 5,143 females, a total of 6,640, or 707 more than the number reported last year.

"In the following counties no institutes were held during the year: Bayfield, Douglas, Florence, Forest, Monroe, Oneida, Portage, Sawyer, Washburn, and Waushara. In these counties, according to the last annual reports, there were 376 schools.

* * * * *

"The committee respectfully submit the following resolution, and recommend the adoption of the same by the board:

"*Resolved*, That the sum of \$5,000 be, and the same is hereby, appropriated, out of the normal school fund income, or so much thereof as may be necessary for that purpose, to defray the expenses of teachers' institutes for the ensuing year, accounts for which may be audited, allowed, and paid by order of the committee on institutes, including the expenses of supervision, which shall be allowed at the same rates heretofore allowed."

At Oshkosh, teachers' meetings have been held once a month during the year, during which the subjects relating to school work were discussed. "Inasmuch as our teachers," says the superintendent, "have never had any special training for the work in which they are engaged, and as the very best instructors must constantly study to retain their superiority, I would suggest that the teachers' meetings be converted into teachers' study classes, and that there be four of them—primary, intermediate, grammar, and high school. In these classes systematic courses of professional reading could be carried on. The philosophy and the history of education should be learned thoroughly. Familiarity with the methods of most successful teachers should be acquired. A prolonged study of mental science should be made."

Teachers' meetings.—The winter session of the Wisconsin State Teachers' Association was held at Madison, December 27, 28, 29, 1887.

The proceedings began with an address entitled, "The Value of Music as an Educational Factor," by Mr. Holt, the supervisor of music at Boston, Mass. Mr. Holt said that any knowledge he had of how to teach music had come to him through teaching the common branches. Good pupils in music can never be made by the method of constant repetition; for expression in music must come from appreciation of the sentiment to be conveyed, not from mechanical perfection. The human voice is the only instrument capable of teaching expression. Not all teachers should be expected to teach music, but only those especially fitted for such work. To teach music it is necessary to understand the laws of the human mind, and the major scale is a sufficient basis for the work.

In presenting the report of the committee on "Elimination of Unprofitable Work from the Curriculum of Graded Schools," Principal Sprague stated that utility, discipline, and culture are the criteria. The usual language books are diluted grammars; the reading lesson should be the basis of language work, technical grammar being retained only so far as it helps logical analysis. The value of geography is questionable, since it is so ephemeral as information. A map of the school ground should be the introduction to map-drawing. Only the central fact of historical, political, and commercial geography should be selected, but these should be thoroughly mastered; the productions of the soil of a whole region should be studied; there should be an abundance of reading material; and, finally, physical geography should follow a course in science. As to arithmetic the objects sought are accuracy and quickness, which the study of natural science can furnish as well as arithmetic. The subject of mensuration and the extensions of percentage should be omitted. During the first year much drill should be had on the nine digits; during the second fractions and measurements (tables of weights and measures) should be taught, and by the end of the third year multiplication and division up to the nines should be firmly fixed.

Professor Smith, of Beloit College, treated the subject of mathematics under two heads—defects and causes. In arithmetic pupils are generally deficient in accuracy and rapidity, the answer not the principle being the chief end. In algebra pupils are deficient in factoring, radicals, and exponents. In geometry pupils are well prepared on demonstration, but lack power to apply principles to original work; demonstrations are not clear, neat, or accurate. The cause lies in the abstract nature of mathematics and faulty textbooks; in algebra quadrates and radicals being poorly represented, in geometry too much being done and not enough suggested in outline to be done in full, in arithmetic percentage is not dwelt on sufficiently. Arithmetic and elementary algebra and geometry should be presented in one book.

State Superintendent Thayer spoke of the interconnection that should subsist between the university and the public secondary, normal, and elementary schools. Normal schools have a specific purpose, the training of teachers and not the imparting elementary knowledge, and their requirements for admission should be clearly defined and rigidly adhered to. Not enough stress is laid upon the theory and art of teaching at the institutes, which is their proper object. In the future the institute must reach a larger number of teachers, and interest in them, by public addresses or otherwise, must be aroused. Professor Maxons, in speaking of the institute problem, said that the institute had two objects: (1) To stimulate the teachers; (2) to do some academic work. For the attainment of the first end probably two days are sufficient, and the best means of occupying them is by lectures. Assistant Superintendent Chandler said that institute work seemed to be losing its hold on the public and blamed the county superintendents for this. The evil might be rectified by requiring regular attendance as a qualification for obtaining a certificate.

The summer session was held at Eau Claire, July 3, 1888. The president, in his address, said that one of the reasons for failure in educational work is unqualified teachers, which is occasioned by the general unwillingness to pay a fair price for teaching. In the discussion of several papers on the study of history and of patriotism, Dr. Stearns stated that of the 350,000 pupils in the State only 8,000 enter the high school, and any knowledge of history that it is desired to give them in the schools must be given in the grammar grades. He would suggest that after the fourth reader a history like Higginson's History of the United States be read. In treating of school libraries, how to get and how to use them, it was stated that teachers must be depended on to take the lead in securing good reading, for parents are indifferent.

CHAPTER X.

SECONDARY INSTRUCTION.

EFFORTS AND PURPOSES OF THE OFFICE WITH RESPECT TO SECONDARY SCHOOLS.

Since 1872 the Office has made great efforts to secure reliable statistics of the secondary school work of the country. Two purposes have animated these efforts; the first was to make the statistical record complete as regards the educational provision of the country, and the number of youth yearly instructed; the second was to collect a body of information relative to secondary instruction, which might lead to a clear understanding of the conditions under which this important part of educational work is maintained, and promote measures for its improvement.

In order to arrive at the desired information, an inquiry as to the number of pupils in private schools has been embodied in the forms issued in successive years for the reports of State systems and city systems. On the other hand, the forms prepared for secondary schools, individually considered, have been sent to public as well as to private schools.

Each year has witnessed an increased fullness in respect to the report of private school enrolment on the first two classes of forms specified, while at the same time the number of individual schools, both public and private, reporting under the head of secondary, has also increased.

It appears that the first purpose of the inquiries, namely, the securing complete statistics of school attendance, is likely to be as fully accomplished as is possible by continuing the inquiries specified on State and city forms.

For the accomplishment of the second purpose, viz, the exhibit of scholastic conditions and tendencies, it is desirable to limit the inquiries to schools which present in their organization and conduct, the recognized characteristics of the secondary grade of educational work. For obvious reasons, discrimination in this respect is extremely difficult. Some progress toward the end desired has been accomplished by the classification of the schools according to the sex of students. The division of the schools into secondary and preparatory, formerly employed in the Reports of this Office, had very little application outside of New England, and even there was the occasion of more or less confusion and complaint. Classification on the basis of sex, which is a basis universally employed, suits the characteristics which are at present stamped upon the private schools of the country in general.

The end under consideration, namely, the exhibit of scholastic conditions, is further served by removing the statistics of public high schools from those of academies, seminaries, etc. The former are regulated by law, and are or should be in great measure adapted to the practical requirements of their respective localities. The latter must, necessarily, owe their distinction, if they possess any, to their power of maintaining the highest order of scholastic ideals. The more clearly and distinctly the work of both classes of secondary schools (*i. e.*, public and private) is displayed, and the more thoroughly it is comprehended, the more certain it is that funds will be forthcoming for its free and full development.

As the high schools of the country are for the most part located in cities, repetition is avoided by including their tabulation in the city systems (Table 24).

The form prepared for private seminaries, endowed academies, etc., contained an inquiry as to the number of pupils below the secondary grade. Schools which reported their entire attendance in elementary grade have not been tabulated. The elimination of these is also, it will be seen, in the line of specialization mentioned previously.

The inquiry as to the number of pupils below academic grade was answered by 54 per cent. of the private schools for both sexes; 44 per cent. of the schools for girls and 42 per cent. of the private schools for boys. The difference between this number and the total enrolment has been entered in the detailed Table 42. The totals have not been included in the summarized view, as they represent less than half the whole number of schools reporting.

SCHOLASTIC WORK OF SECONDARY SCHOOLS.

The important part which private schools perform in the preparation of students for colleges is indicated by the analysis of statistics relating to that work recently collected by this Office.

Massachusetts led all the States in the number of schools answering the inquiry upon that point, and as all classes of secondary schools are well represented in that State, and all well organized, the information supplied therefrom is particularly significant.

The schools of Massachusetts answering this special inquiry were classified as follows: High schools, 71; private schools for girls, 17; private schools for boys, 17; private schools for both sexes, 31.

The proportion of students reported as preparing for college or for scientific schools in the several classes of schools were as follows: High schools, 15 per cent.; private schools for girls, 10 per cent.; private schools for boys, 63 per cent.; private schools for both sexes, 10 per cent.

Of the seventeen private schools for boys included in the report from Massachusetts six are endowed academies, and four others possess property ranging in value from fifty to two hundred and fifty thousand dollars. Twelve of the seventeen schools reported each more than 50 per cent. of their pupils preparing for colleges or for superior schools of science.

For the other classes of schools the proportions were much lower. Three private schools for girls reported from 40 to 80 per cent. of their pupils in preparatory course, while in the remaining fourteen which made any report under this head the highest ratio was 11 per cent. Of the mixed schools two reported above 40 per cent. of their pupils in preparatory courses, the ratios for the remainder ranging from 1 to 37.

Of the public high schools one, namely, the Boston Public Latin School, had 100 per cent. of its pupils in preparatory courses; one, the North Brookfield High School, 75 per cent.; two others reported, one 30 per cent., the other 40 per cent.; nine others between 20 and 30 per cent., while for the remainder the ratios were less than 20 per cent.

The statistics for the country at large have the same general bearing as those for Massachusetts. They show a much larger proportion of pupils in the private schools for boys preparing for college and for scientific schools than in the other classes of schools answering the inquiries. The percentages as reported were as follows: Public high schools, 10 per cent.; private schools for girls, 2 per cent.; private schools for both sexes, 7 per cent.; private schools for boys, 32 per cent.

The inquiries of the Office as to the scholastic work of secondary schools for the present year were directed to the following particulars: First, the amount and character of special training; second, the relative time devoted to the principal studies of the general curriculum, and the number of students pursuing each. The special training is of two classes,—commercial or business, and the professional training of teachers. The statistics relating to these particulars are summarized in Chapters IX and XVI, treating of the specified particulars.

The information elicited by the inquiries relative to curriculum and the division of time in private secondary schools has been summarized in Tables 36 and 37.

For convenience of reference and study the corresponding information from public high schools is summarized in the tables immediately following, viz, 38 and 39.

The foregoing table presents in part the results of an inquiry respecting the time assigned to the specified studies in systematized courses of secondary instruction. The inquiry called for the number of hours in a week assigned to each study, the number of weeks in a year, and the number of years in the course.

On account of different interpretations put upon the inquiry and the different conditions existing where the interpretations were the same, it was impossible to embody all the information elicited in a single tabular scheme.

Choice has here been made of answers relating to courses of four or of five years' duration, which are the periods generally comprised in secondary instruction.

In selecting the answers for tabulation it was necessary also to distinguish between those that pertained to the work of a class as arranged for a continuous course and those that evidently gave the time devoted by all classes to the several studies or the time occupied by the teachers of those studies. The distinction was indicated by the total number of hours making up the school week. The choice was farther limited to the reports which included the three lines of study embraced in the inquiry, viz, language, mathematics, and physical science.

The reports of seventy-five schools accorded with the basis of choice thus determined. Of these nine made equal division of time among the several studies. The relative distribution of time for the remainder is shown in Table 37. The total number of hours tabulated was found by multiplying the number of hours assigned to each study in a week by the number of weeks it is pursued in a year, and the number of years in the course, and adding the products.

The plan here described was followed also in the preparation of Table 39, which presents the corresponding information for seventy-one public high schools. The few departures from the length of the course selected are indicated by foot-notes.

STATISTICAL SUMMARY OF SCHOLARS IN SECONDARY SCHOOLS AND DEPARTMENTS

The principal statistics relating to endowed academies, seminaries, and other private schools for the present year are summarized in Table 40 and Table 41, Divisions A, B, and C. These show a total of 1,165 schools having 7,221 instructors and 126,721 scholars. In addition to the attendance upon these schools, scholars pursuing secondary courses in public high schools and in preparatory departments are reported as follows:

Class of School.	Number of Scholars.
Public high schools, Table 24.....	116,000
Preparatory departments of colleges and of seminaries for women, Table 43.....	6,202
Preparatory departments of colleges of liberal arts, Table 47.....	27,203
Preparatory departments of colleges endowed with the national land grant, Table 52...	1,431
Preparatory departments of schools of science, Table 56.....	562
Total.....	151,412

This gives, with the scholars in private schools, a sum total of 278,133.

The following shows the number of endowed academies, seminaries, and other private secondary schools, reporting to this Office each year from 1878 to 1888 inclusive (1883 omitted), with the number of instructors and students. It should be noted that on account of the exclusion of all public schools, the statement for years preceding 1888 differs from the corresponding statements published in previous Reports.

DETAILED VIEW OF PRIVATE SECONDARY SCHOOLS.

The detailed statistics of endowed academies, seminaries, and other private schools are presented in Table 42, Divisions A, B, and C. As a means of affording a somewhat clearer conception of the variety and scope of secondary institutions special statements of several are here presented, together with brief notices of certain other instrumentalities for the promotion of this grade of educational work.

The *McDonogh Institute*, McDonogh, Md., differs in several important particulars from other endowed secondary schools. Pupils enter at about twelve years of age and leave when between sixteen and seventeen; some to seek professions, the great majority to enter upon industrial or commercial pursuits. The great endeavor of the institute therefore is to train boys "to become faithful and efficient workers in the world."

The entire course occupies six years of forty-two weeks each, but four years is the average time spent by pupils in the work. On account of the peculiar character of the school it is difficult to present the programme in a scheme adapted to schools which make preparation for college a special feature.

The following extract from the catalogue for 1887 gives a very full statement of the plan of studies and the discipline of the school:

"A thoroughly healthy location, and the wide range the farm affords, give us an excellent basis for physical development. This is utilized by a good deal of active outdoor life. Part of this outdoor exercise comes in the way of work—tasks of garden and farm labor—by means of which the boys receive a portion of their hand-craft instruction, but so far as physical development is concerned, the most valuable part of this outdoor exercise consists in the open-air sports to which they are devoted. Not only are foot ball, base ball, and other athletic games kept up with great zest; our wide woodland and numerous streams afford opportunities for wood and water sports which have been fully used. All outdoor sports are encouraged, and our opportunities for these are so exceptionally good that we have never suffered, in good weather, from the lack of a gymnasium, and indeed have preferred the zealous pursuit of these free sports to any other system of physical exercise. Care has been taken to re-enforce these means of physical training by good sanitary arrangements—including well-ventilated rooms and simple diet—and by the establishment of healthy habits of life.

* * * "The curriculum is necessarily shaped by the limited time at our disposal and by the probable careers upon which our graduates will enter. It is from these points of view that the classics have been excluded from our regular course. They are not best suited for the training of youths who are to go into active life at seventeen or eighteen. Special opportunities for classical study are given to those scholars who expect to enter college or university. The leading subject of study in our school course, especially in the earlier years, is the English language, the knowledge and use of which are considered of the first importance. At the end of the second year German is introduced. The language teaching (including both English and German) occupies about one-third of the whole time assigned to study. Next comes mathematics, to which is assigned about one-fourth of the entire study time, and which is taught with careful reference to the training of the growing reasoning faculties.

"Geography in the earlier years is followed by American and English history in the later. The course in science embraces the elements of some science of observation, like botany or zoölogy, followed in the last year by physics or chemistry. Physiology has an important place because of the conviction that any educational scheme which leaves the scholar ignorant of the organs and functions of his own body and the healthful use of them is a travesty. Drawing is a part of the work of every class; book-keeping and short-hand are taught to the upper classes, because of their utility; and instruction in vocal music, according to the requirement of the founder, is given to the whole school. This course of study, which is shown in detail in the schedule, consumes on the average about thirty-one hours per week. That is, this amount of time is spent with the teacher, either in recitation or preparation, to which is to be added, especially in the higher classes, a considerable amount of study done by the boys in their own time. Besides this work in the school-room, there is the manual training instruction and practice, which occupies about nine hours per week of each boy's time, and includes shop-work, printing, type-writing, and garden and farm work.

"The highest aim and best result of any system of school training is the development of character. This is promoted more by the instilling of good principles than by the instilling of knowledge, and it depends more upon the establishment of habits of correct feeling, thinking, and action than upon the instilling of either principles or knowledge. Hence the importance of a systematic and uniform discipline, suited to form those habits of life which will conduce most to efficiency and usefulness in after years.

"Hence the even greater importance of cultivating right views and feelings. This can only be done when the relation between teacher and scholar is one of mutual confidence and respect. The intercourse between our scholars and their superiors is friendly and

unrestrained. The teachers participate in all the leading games and sports of the boys. No reserve keeps the boys at a distance, no espionage renders them uncomfortable. Truth, honesty, and fair dealing are the basis on which it is assumed that all wish to stand, and the boys are encouraged to maintain this basis. Their sense of responsibility is developed by placing many matters under their own control and by consulting them about others. Thus jurisdiction is given them over offences committed by one boy against another. These matters they regulate with firmness and good judgment. Offenders are often regularly tried by them, and rarely have their decisions been found harsh or unjust. Cheating in recitation or other school work is almost unknown, because of the strong public sentiment against it, and of the promptness with which the boys repress it. This matter is in their charge almost altogether. A boy guilty of such practices is looked upon as one willing to take unfair advantage at the expense of his fellows. He loses caste and soon finds it necessary to reform his practices, and a reform of principles is likely to follow. * * * Our boys, in short, constitute a community; they are taught as far as possible to govern themselves with justice and right; the moral and religious lessons given them are impressed by practice; they learn from experience the value of good motives of action, and the inconvenience and sorrow that flow from bad ones."

For 1886-87 the schedule of studies was as follows:

Classes.	English.	Geography.	History.	German.	Mathematics.	Physical Science.	Biology.	Writing.	Short-hand.	Drawing.	Book-keeping.	Musie.	Total.
First.....	4	3	6	6	6	4	2	2	33
Second.....	5	3	6	7	4	4	2	2	33
Third.....	5	3	5	7	3	2	31
Fourth.....	5	10	30
Fifth.....	9	4	9	28
Sixth.....	9	4	9	28

The *Savin Academy and Dowse High School*, Sherborn, Mass., is an endowed school, having substantially the same course as an English and classical high school, with special facilities for preparing boys for technical institutes. It reports distribution of time as follows:

Studies.	Hours per Week.		Weeks each Year.		Years in Course.		Studies.	Hours per Week.		Weeks each Year.		Years in Course.	
	C.	S.	C.	S.	C.	S.		C.	S.	C.	S.	C.	S.

French.....	(3)		(37)		(2)		Chemistry.....	(5)		(37)		(1)	
							Other sciences a.....	(5)		

a Geology and Natural History and Astronomy; two terms each.

Thayer Academy, South Braintree, Mass., is an endowed school intended to supplement the school system of the town. It offers two courses of study to graduates of the high school or to those who have had at least two years at a high school. One of these courses is called the general; in this English, mathematics, and modern languages predominate; the other is preparatory to college. Both courses are the same during the first year, so that distinction between the two does not begin until the second year.

The following is the programme of studies and time as reported for 1887-88:

Studies.	Hours per Week.		Weeks each Year.		Years in Course.		Studies.	Hours per Week.		Weeks each Year.		Years in Course.	
	C.	S.	C.	S.	C.	S.		C.	S.	C.	S.	C.	S.

							Other sciences <i>c</i>	2	2	19	19	1	1

a Classical, five hours first year, two hours second, third, and fourth years.

b Scientific, three hours first year, one hour each second and third years.

c Astronomy by lectures to the whole school.

The *Phillips Exeter Academy*, Exeter, N. H., is a school of distinctly secondary grade. Candidates for admission must be at least thirteen years of age, must present certificates of character and a full statement of the amount and kind of work previously accomplished.

The school comprises two courses, classical and English. The students in the former are all preparing for college, which work covers a period of four years. The English course is designed for students who do not purpose entering college. It includes all the requirements for admission to the Massachusetts Institute of Technology, the Sheffield Scientific School, and similar institutions.

The total attendance for the present year is three hundred and twenty pupils, of whom 67½ per cent. are in the classical course. The academy is well endowed, possesses a fine gymnasium, and has excellent provision for science instruction which will be greatly increased by the new laboratory now in process of erection.

Liberal provision is made for meritorious students who have not the means of defraying their expenses at school. During the past year \$1,670 were appropriated for scholarships, free tuition was given to ninety-two scholars, and the sum of \$135, contributed by the alumni association, was lent to meritorious students.

The *Preparatory School for Lehigh University*, Bethlehem, Pa., offers a course arranged with special reference to the admission requirements of that university. Experience shows that the young men who have mastered these have no difficulty in passing the examinations for admission to other universities.

The following schedule of studies and time is reported by the school:

Studies.	Hours per Week.		Weeks each Year.		Years in Course.		Studies.	Hours per Week.		Weeks each Year.		Years in Course.

German.....	4	35	2							

The *William Penn Charter School*, Philadelphia, Pa., founded in 1639, has nearly reached its second centennial. It has an ample endowment, a superior teaching force, and full equipment as a college preparatory. The following detailed account of its organization is taken from the catalogue for 1887-88:

"The school is arranged in six classes, and these classes, when their size demands it, are subdivided into sections. The work of each class covers a period of one year. The three upper classes constitute the senior school, the three lower the junior school.

"The staff consists of a head master and thirteen assistants. The head master, in order that he may concentrate himself wholly upon the management of the school, is relieved both of teaching and of clerical work. Each subject of study, or at most two, constitutes a distinct department and is placed in charge of a competent specialist, whose entire time and efforts are devoted to this school; that is, the school enjoys the advantage of a complete and exclusive staff of experienced specialists.

"The requisites for admission to the senior school are, ability to read English with ease and expression, to spell any word of common occurrence, to work all the important rules in arithmetic, to read and parse selections from *Cæsar's De Bello Gallico*, III, to take up with profit such French as *About's Le Roi des Montagnes*, and to pass an examination in general geography and the history of the United States.

"From the examination of those new boys who choose the classical side, French will be omitted; from that of those who choose the modern side, Latin will be omitted. Provided a candidate's ability were above the average, and his knowledge of English and mathematics at least one year in advance, it would be possible for him to enter with no knowledge of either French or Latin, as the desired language could be brought up by extra lessons during the periods which would otherwise be occupied by English and mathematics.

"The course of study of the senior school is arranged to meet the wants of three classes of students,—those intending to complete their studies at school, those preparing for a scientific or technical school, and those aiming for a classical course in college; the first named take the modern side, the second the modern side with modifications, the third the classical side.

"The requisites for admission to the junior school are ability to read and spell selections from a third reader, to work federal money and decimal fractions, to pass an examination in the geography of the United States, and to write a legible hand.

"The school has a completely equipped gymnasium in charge of a member of the staff, who has given special attention to physical education, and every boy is required to exercise daily under his supervision."

The course comprises six years of thirty-six weeks each, the division of time being as follows:

Hours Assigned to—	Classical Course.	Scientific Course.	Hours Assigned to—	Classical Course.	Scientific Course.
English language and literature.	1,358	1,368	Physics.....	432	144
Latin.....	792	288	Chemistry.....		
Greek.....	540		Geography.....		360
French.....	216	720	History.....		
German.....		540	Drawing.....	216	216
Mathematics.....	864	864	Penmanship.....	144	144

The Cambridge School for Girls, Cambridge, Mass.—The increasing efficiency of secondary schools for girls is one of the most important results of the movement for the higher education of women. It is indicated by the large number of college graduates who are sought as principals or teachers by the number of schools established for the professed purpose of preparing girls for college, and by more thorough and definite work in the entire course of training for girls.

One of the most recent examples of secondary schools growing out of this movement is the Cambridge School founded by Mr. Arthur Gilman, who furnishes the following relating to it: "My experience led me to found the Cambridge School for Girls in 1886, and more than sixty young women are now instructed in it in a building adjoining the 'Annex.' The teachers in the Cambridge School are eight—one graduate each from the Annex, Wellesley College, and Smith College, two from the State Normal School at Framingham, and a teacher in each of the departments of German, French, and drawing."

AGENCIES FOR PROMOTING SECONDARY INSTRUCTION.

The value of private instrumentalities in the work of secondary instruction cannot be questioned; but it is evident that the absence of all legal requirements with respect to material resources and the professional qualification of teachers gives opportunity for the existence of inferior schools. As communities advance, however, inferior schools find less and less favor, while those that are suitably equipped voluntarily seek the conditions most favorable to successful work. Thus there is seen to be a natural tendency to improvement in the private as well as in the public schools of progressive communities; nevertheless the opinion is very general that the former should be regulated by law to some extent.

Thus far New York is the only State in which provision has been made for the systematic supervision of private schools considered apart from their relation to colleges. This is done by means of the regents' academic examinations, which were fully described in the Report for 1886-87. As there stated no school can share in the literary fund unless it comes under these examinations, and in order to secure this privilege it must fulfil the required conditions with respect to buildings and equipments.

The examinations, instituted originally with sole reference to the distribution of the literary fund, have proved to be of much greater importance as a means of systematizing and stimulating the work of the schools.

In 1886-87 the number of academies visited was 294, having 1,376 teachers and 39,523 scholars, of whom 14,448 were academic. The total number of subjects covered by the three grades of academic examinations was 41. The number of answer papers submitted was 92,103, and the number for which allowances were made from the literary fund was 84,440.

In several States, associations have been formed, some long standing, others of recent organization, which have for their object the improvement of secondary instruction. The Office has received the report of but one such during the year under review. The following is a brief résumé of the proceedings at its annual meeting.

The organization known as "The Associated Academic Principals of the State of New York" held its third annual conference at Syracuse, December 27 and 28, 1887.

"The committee appointed to represent the Associated Principals at the Conference of College Presidents, in connection with the convocation in June, reported that a series of resolutions was prepared and submitted to the conference. The discussion, however, resulted in nothing definite, and the question of college admission remained much as before."

Following the report of the committee the first subject discussed was "The Teaching of English." The importance of the branch seemed to be fully recognized and progress was reported both in the methods and the results of the instruction. The "Teaching of Greek" and the "Regent's examination in mathematics" were also considered.

Among the resolutions which were unanimously adopted were the following:

"That the increasing attention given by our schools to the study of English is gratifying and should be further encouraged, and the correction of errors of expression should be such as to stimulate the pupil's thought.

"That the use of special topics in the English literature and history regents' examinations is helpful in arousing a spirit of original investigation.

"That it be the expressed opinion of the Associated Academic Principals that the time now prescribed by the regents for the examinations in mathematics is the proper time.

"We wish especially to commend the excellence of the questions sent out from the regent's office, contributing, as they do, so effectually to raise the standard of scholarship in the secondary schools of the State.

"That we request the colleges of the State to accept the regents' diplomas instead of an entrance examination for the subjects covered by them."

The Massachusetts Association of Classical and High School Teachers and the New England Association of Colleges and Preparatory Schools are vigorous societies whose influence is felt throughout the country. Similar societies are working successfully in Western States; among the most efficient of these is the Northern Illinois High School Teachers' Association. As a rule, State teachers' associations have a department devoted to the interests of secondary instruction. The inquiries, discussions, and practical efforts of these organizations are reflected in the advancing standards and the better organization of this department of educational work.
